### 9.3 Conclusions of the Complex Assessment

The Complex Assessment involved the manual excavation of four 1m x 1m test pits (TPs) and five 0.5m x 0.5m radial test pits (RTPs). A further forty-nine 2m x 1m machine test pits (MTPs) were excavated using a machine excavator. All test pits were excavated stratigraphically or in defined arbitrary spits of 100mm. All excavated material was screened using either 5mm gauge hand sieves or 5mm gauge mechanical sieves. The test pits were spaced throughout the activity area to sample as much of the area as possible and to target landforms identified during the Standard Assessment as archaeologically sensitive.

The soil profile was fairly homogenous across the activity area, generally consisting of a brown sandy silt topsoil above an intermediate sand layer and basal clay. The depths of the test pits varied greatly across the Activity Area but were generally deeper in areas on or near contour lines associated with Bruce Creek.

A total of 312 artefacts were found in fifty-eight subsurface testing locations across the activity area. The majority of subsurface artefacts were recorded within the top brown sandy silt layer at depths generally ranging between approximately 150-300mm. However, there were also artefacts recorded within the intermediate sandy silt layer at depths generally ranging between approximately 250-450mm. The highest densities of artefacts were found in MTP61 and MTP22 which were located in Section 4, on the plains and ridgeline leading to Bruce Creek. Approximately 86% of all subsurface artefacts recorded in the activity area were found in Section 4.

The results of the Complex Assessment support the conclusions of the Desktop and Standard Assessments that found low-density and/or diffuse Aboriginal cultural heritage present across the activity area but also with a far larger concentration of stone artefacts in the areas most closely associated with Bruce Creek.

## 10.0 Aboriginal Cultural Heritage in the Activity Area

### 10.1 Ormond Street Bannockburn LDAD (VAHR 7721-1436)

The following section provides details and analysis of Aboriginal cultural heritage identified during the Standard and Complex Assessments. The Primary Grid Coordinate for Ormond Street Bannockburn LDAD (VAHR 7721-1436) is E:250720, N:5784135 (MGA/GDA94, Zone 55).

#### 10.1.1 Artefact Analysis

Attribute and technological analyses were undertaken on the assemblage observing the typological categories prescribed by AV. The definitions and interpretation of lithics primarily followed those outlined in Holdaway and Stern (2004). The collected subsurface lithic artefacts were sorted prior to analysis. The attributes of the artefacts were recorded using electronic callipers and a DN1040 table magnifying lamp, which provided 1.75 to 4x magnification to assist in identification of use-wear, retouch, flaking scars and raw material type in the laboratory at the TerraCulture offices.

Table 13: Summary artefact analysis of VAHR 7721-1436.

### 10.1.2 Site Formation Processes

The stone artefacts recorded during the Complex Assessments were registered with Aboriginal Victoria as Ormond Street Bannockburn LDAD (VAHR 7721-1436). This Aboriginal place lies on a flat volcanic plain approximately 200 metres west of Bruce Creek. Most of the artefacts were found within the brown sandy silt topsoil layer, however some artefacts were found within the lighter brown firm sandy silt intermediate layer. It is likely that disturbance has allowed artefacts to shift within the deposit. Overall, the place has poor contextual integrity and there was evidence of some ground disturbance by agricultural practices such as ploughing and livestock grazing, as well as by the construction of two houses and other various amenities.

VAHR 7721-1436 has been registered as a low-density artefact distribution. As per Aboriginal Victoria's Guidelines for Recording Low Density Artefact Distributions, a low density artefact distribution is defined as 'the occurrence of stone artefacts at densities of up to 10 counted artefacts in any area of approximately 10m x 10m, or 100m<sup>2</sup>, including within a single test pit of ≤1m<sup>2</sup>'. Further, the guidelines state that 'there should be a maximum of one kilometre between the artefacts recorded in a single LDAD submission'. Although a total of twenty artefacts were registered within this LDAD, the findings do not see more than ten artefacts within the defined area of 10m x 10m, or 100m<sup>2</sup>, well within the density threshold. It is unclear whether the artefacts were discarded as a single discreet event or if the place was visited numerous times. It is likely that water erosion and other agricultural activities have caused some of the artefacts, at least, to have shifted within the sandy silt making it unlikely that the artefacts were recorded *in situ*. The artefact assemblage is very small, consisting of twenty quartz and quartzite artefacts, which makes inferences about the discard patterns difficult. This coupled with the disturbed context in which the artefacts were recorded makes it difficult to understand the site formation processes.

### 10.1.3 Results of the Artefact Analysis

The stone artefact assemblage that makes up Ormond Street Bannockburn LDAD (VAHR 7721-1436) consists of twenty artefacts made from quartz and quartzite. The largest number of artefacts were made from quartzite (n=19) which would have been common in the region. There is no source of quartzite within the Activity Area, however, and it was likely sourced from the Moorabool River. The results are consistent with previous assessments that indicate that quartz, quartzite and silcrete are the most common raw materials in the geographic region (e.g. Marshall and Hyett 2007, Bullers et al. 2014).

Quartzite is a quartz-rich sandstone that has been recrystallized by heat and/or pressure. It is also a commonly occurring raw material in stone tool assemblages in the region. Fine-grained varieties are better suited to knapping than coarser-grained varieties which produce irregular breakage patterns (Holdaway & Stern 2004: 24).

Quartz is a difficult raw material to work with due to natural imperfections in the crystalline structure which make breakage patterns often unpredictable (Holdaway & Stern 2004: 24). Nevertheless, it is common in Aboriginal stone tool assemblages for its ability to form durable sharp edges with little effort.

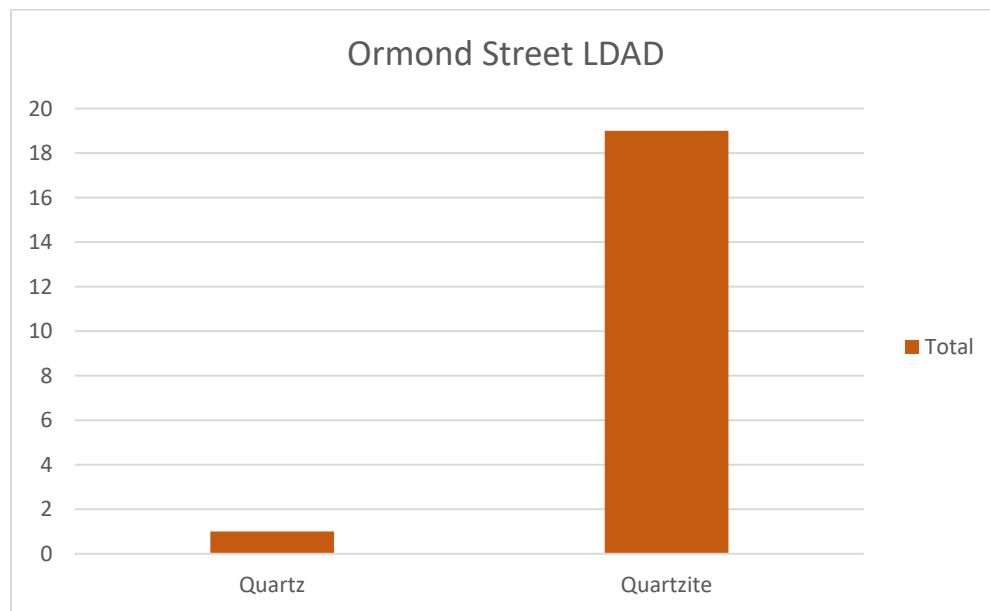

Figure 18: Raw material frequency in VAHR 7721-1436.

All artefacts recorded during the assessment were produced using stone flaking techniques with the most common primary forms being complete flakes and complete blades. The low number of artefacts and the lack of angular fragments suggests that the place was unlikely to have been used as a place of large-scale stone tool manufacture or encampment. Instead, the primary forms suggest that the place was likely only a peripheral place of occupation and most flakes and tools used in everyday activities were produced elsewhere and transported to site before being discarded.

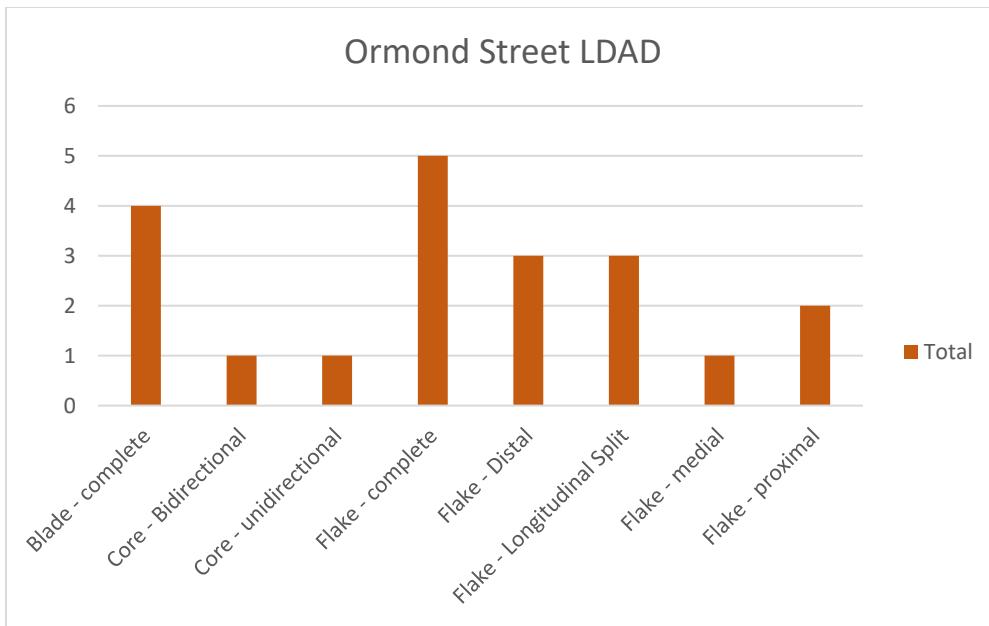

Figure 19: Primary form frequency in VAHR 7721-1436.

#### 10.1.4 Nature of Ormond Street LDAD (VAHR 7721-1436)

Within the activity area, Ormond Street LDAD (VAHR 7721-1436) consists of twenty quartzite and quartz artefacts found in subsurface test pits. The scatter is located within Sections 2 and 3 of the Activity Area, in flat paddocks approximately 200 metres west of Bruce Creek. Most of the artefacts were found within the brown sandy silt topsoil layer, however some artefacts were found within the lighter brown firm sandy silt intermediate layer. Overall, the place has very poor contextual integrity and there was evidence of major ground disturbance by agricultural and viticultural practices such as ploughing. Disturbance caused by humans and animals while the artefacts were on the surface is also likely to have occurred.

Photograph 57: MTP2, quartzite flake, 15cm depth.

Photograph 58: MTP19, quartzite distal flake showing dorsal and ventral sides, 28cm depth.

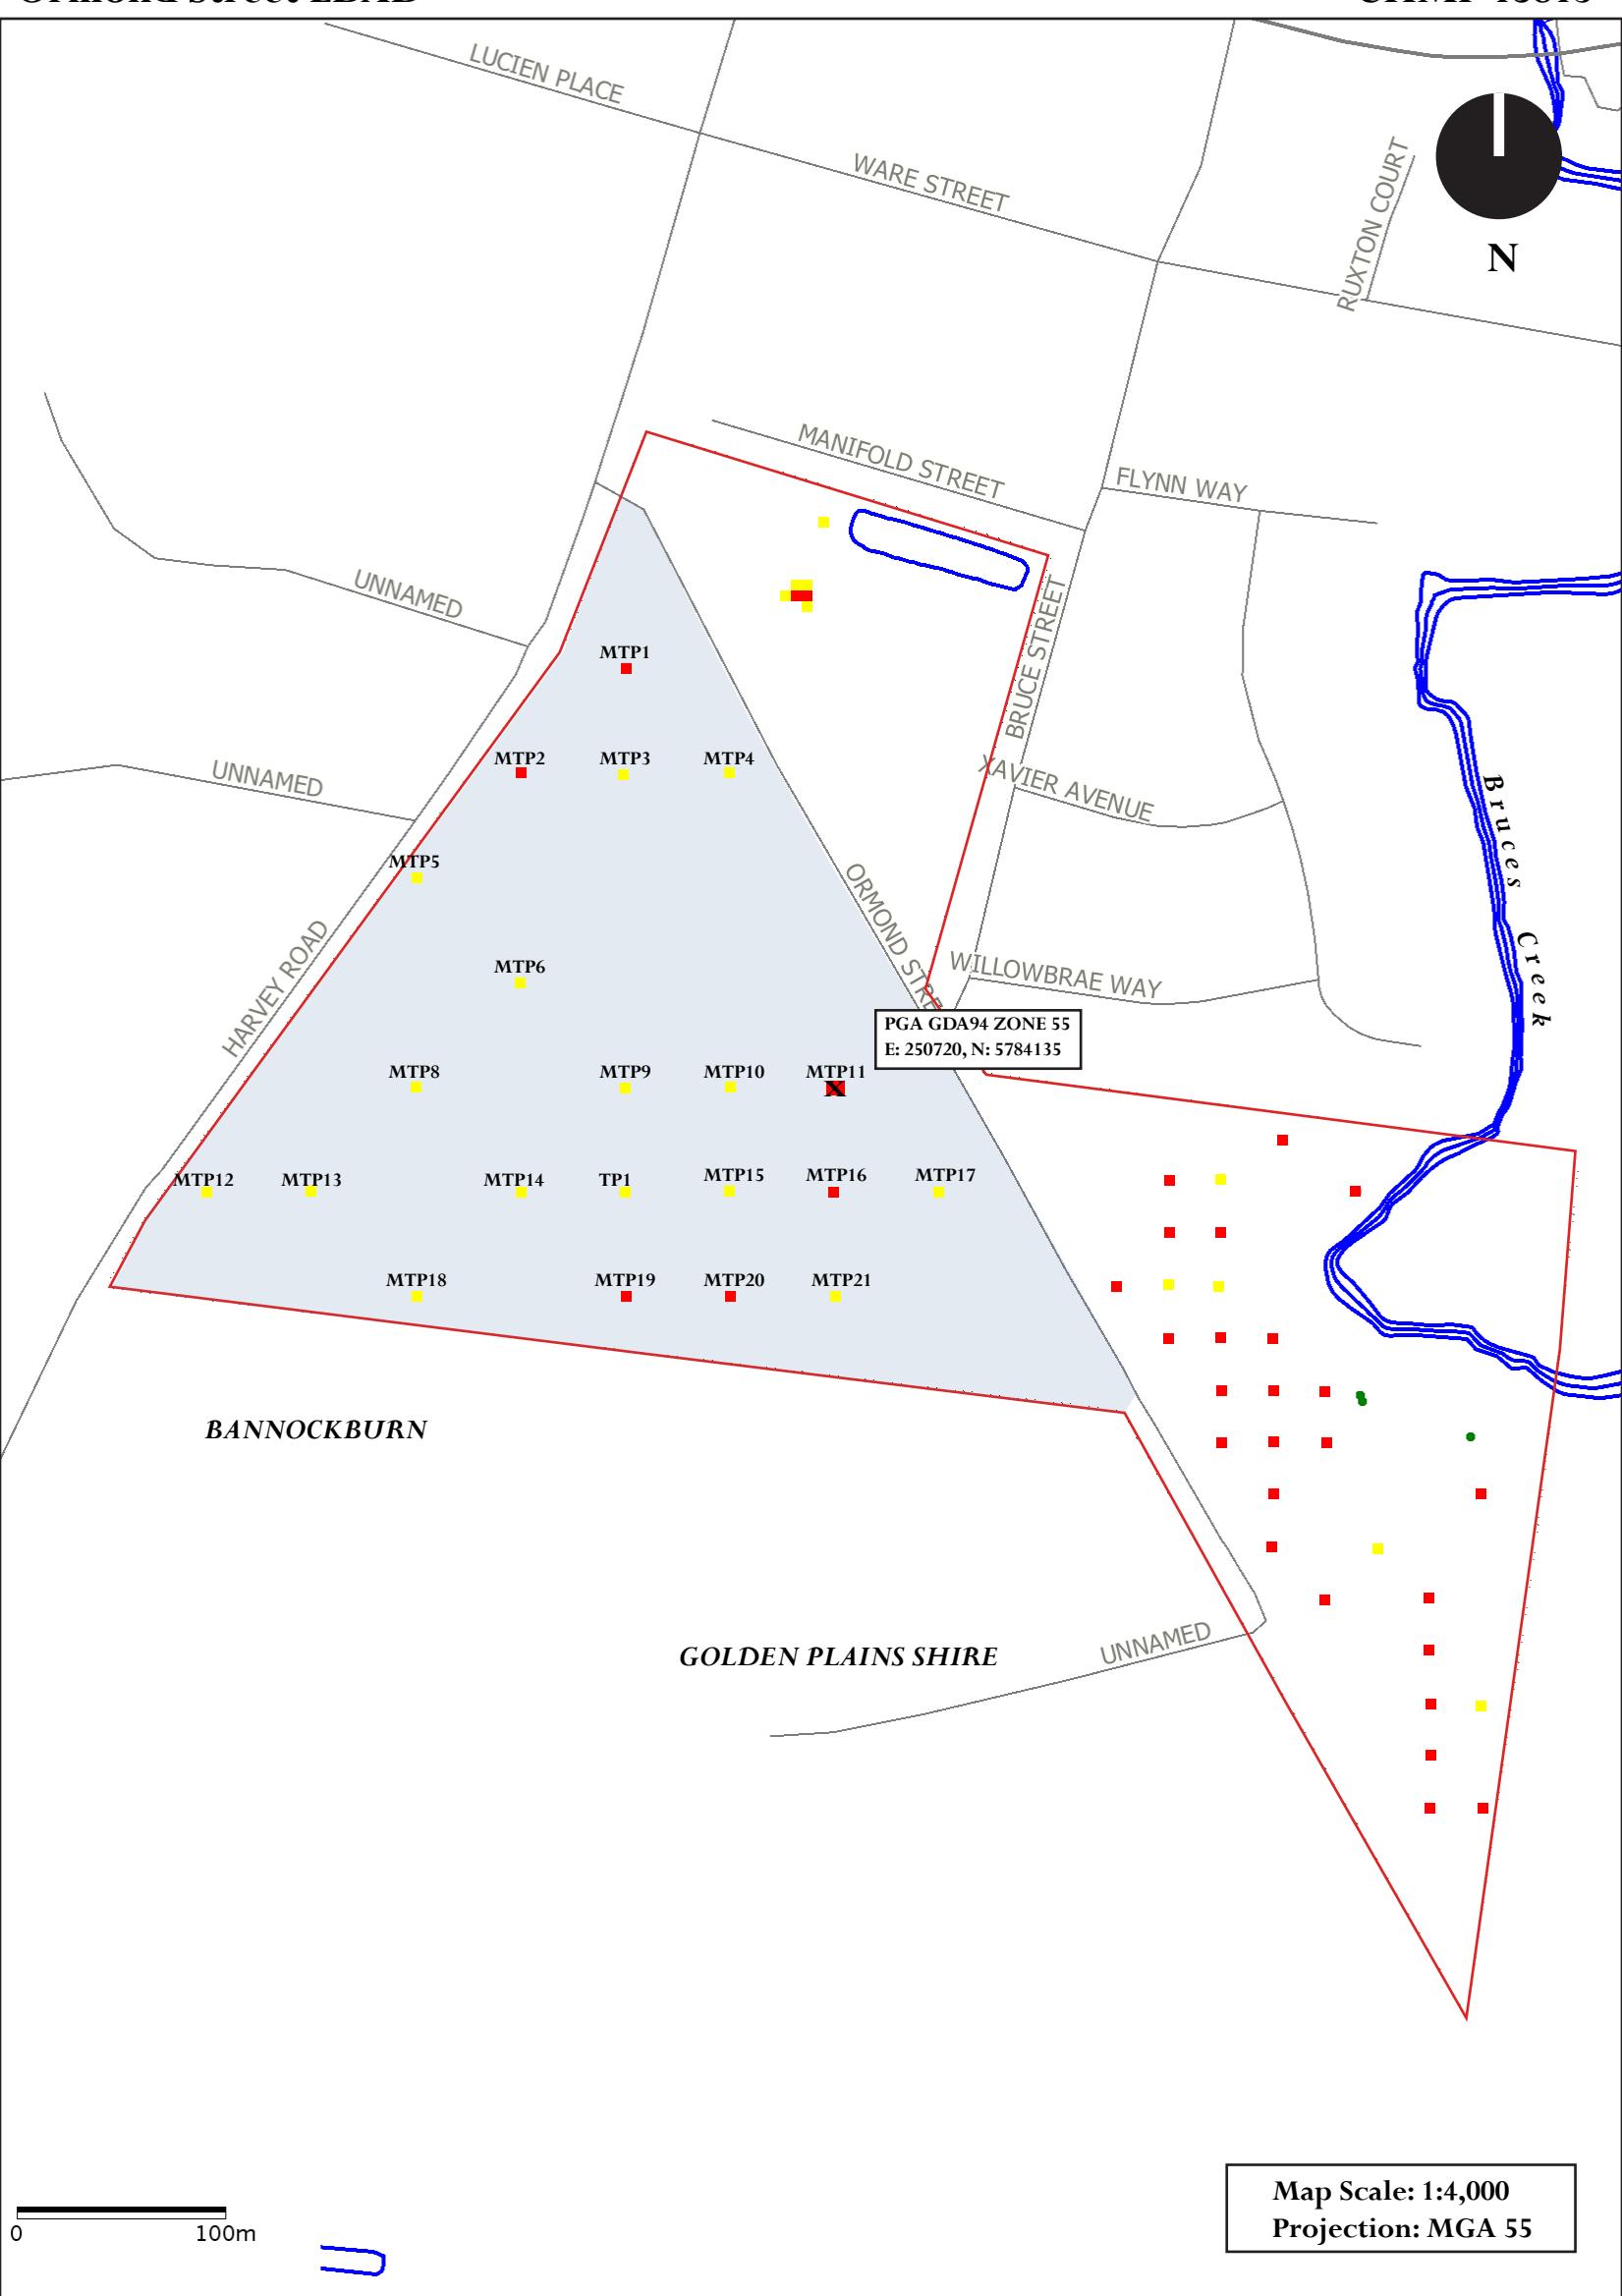

### 10.1.5 Extent of Ormond Street Bannockburn LDAD (VAHR 7721-1436)

Ormond Street Bannockburn LDAD (VAHR 7721-1436) was registered with Aboriginal Victoria as a low-density artefact distribution which means it does not have a formal place extent. Instead, each artefact is a separate component. MTP2 had the highest density of artefacts ( $n=10$ ), and MTP1 had the second highest density of artefacts ( $n=5$ ). The entirety of Sections 2 and 3 within the activity area has been

disturbed by European land-use over the last 150 years, which has likely affected the density and distribution of the artefacts.

## 10.1.6 Significance of Ormond Street Bannockburn LDAD (VAHR 7721-1436)

### Significance Criteria

Aboriginal Cultural Heritage Places that are represented by archaeological features and deposits are a non-renewable resource. For most areas of Victoria, archaeology is one of the few sources of historical information on the former Aboriginal peoples that occupied the land prior to European settlement. Section 4 of the *Aboriginal Heritage Act 2006* includes archaeological, anthropological, contemporary, historical, scientific and social or spiritual significance values in its definition of cultural heritage significance.

### Scientific and Archaeological Values and Significance

Scientific or archaeological significance measures importance according to a number of criteria such as type, artefact density, and potential to provide information of scientific or educational value. Some archaeological sites, by their contents or antiquity, automatically attain a high degree of significance. For others, significance is based on their value as representative examples of types within a given geographical area or environmental context, or their rarity within an area. In assessing the degree of significance of a Place it is necessary to consider four comparative criteria (Russell and Winkworth 2009:10):

- Provenance;
- Rarity or representativeness;
- Condition or completeness;
- Interpretive capacity.

Scientific Significance is ranked according to the following categories or combination of categories:

- High;
- Medium;
- Low; or
- None.

High Scientific Significance means that the Place has good contextual integrity, has demonstrated or potentially demonstrates high values for research potential or comparative ability. A Place assessed to have no Scientific Significance is usually allocated to Places that have no contextual integrity, the

provenance is poor or has been disturbed to such an extent that the information value has been removed or modified.

The criteria used to assess Scientific Significance are not standards that can necessarily be measured in a scientific fashion. They are relative estimates based on the current state of knowledge of the archaeology within the general region and within the specific area under consideration.

### **Statement of Scientific Significance**

Ormond Street LDAD VAHR 7721-1436 has been assessed as having low scientific significance or potential, given the low density of artefacts, the poor integrity of the site and the commonness of the place within the geographic region.

Many archaeological studies and CHMPs have occurred in the geographic region resulting in the registration of ninety-one Aboriginal cultural places. Low density artefact scatters are the most common registered place-type in the geographic region, making up fifty-nine of ninety places. In addition, most of the previous CHMPs in the geographic region have resulted in the identification of stone artefacts which suggests that they are common in the region.

The condition or completeness of the place is poor, with evidence of ground disturbance from previous land-use activities. Other disturbance includes the impact of animal burrowing and natural processes, such as movement of sediments by water and bioturbation.

The interpretive capacity of the place is low, due mainly to the low density of artefacts making it difficult to complete meaningful statistical analysis and the previous disturbance of the landform. However, the place can be fit into a wider framework for analysing Aboriginal occupation within the wider region.

VAHR No.	Primary Coordinates	Site Representativeness	Integrity	Research Potential	Educational Potential	Scientific Significance
7721-1436	MGA94 Zone 55 (Easting/ Northing)	250720/5784135 Regionally Common	Locally Common	Poor	Low	Low

Table 14: Significance Assessment.

### **10.1.7 Cultural Significance According to Aboriginal Tradition**

No specific comments on the cultural significance of VAHR 7721-1436 were provided by the WTOAC members involved in the conduct of the assessment. However, all cultural material is significant to the

Aboriginal community as it provides a tangible link to the past, a connection to country and is a non-renewable source of information about the lifestyles of the ancestors of the Wadawurrung people.

A general statement of significance for all sites from Mr Bryon Powell, former Chairperson of the Wadawurrung Traditional Owners Aboriginal Corporation is documented below:

*"All sites within the Wathaurung area are significant in cultural terms as they are a tangible link to our past and a non-renewable source of information about the lifestyle of our ancestors.*

*The cultural significance afforded to the sites by the Aboriginal community must be given a higher standing than the scientific rating as the scientific rating is based on a European perspective without due regard to the value of the Aboriginal culture as a whole."*

## **10.2 Brunes Creek Artefact Scatter (VAHR 7721-1435)**

The following section provides details and analysis of Aboriginal cultural heritage identified during the Standard and Complex Assessments. The Primary Grid Coordinate for Brunes Creek Artefact Scatter (VAHR 7721-1435) is E:250905, N:5783990 (MGA/GDA94, Zone 55).

### **10.2.1 Artefact Analysis**

Attribute and technological analyses were undertaken on the assemblage observing the typological categories prescribed by AV. The definitions and interpretation of lithics primarily followed those outlined in Holdaway and Stern (2004). The collected lithic artefacts were sorted prior to analysis. The attributes of the artefacts were recorded using electronic callipers and a DN1040 table magnifying lamp, which provided 1.75 to 4x magnification to assist in identification of use-wear, retouch, flaking scars and raw material type in the laboratory at the TerraCulture offices.

Table 15:Summary artefact analysis of VAHR 7721-1435

### 10.2.2 Site formation processes

The stone artefacts recorded during the Standard and Complex Assessments were identified as being an extension of a previously registered site to the north of the Activity Area (VAHR 7721-0835). The artefacts previously registered as VAHR 7721-0835 were located on the same landform and were found in a similar context to the artefacts identified during current investigations (Clark 2007, CHMP 10068). Therefore, Bruces Creek Artefact Scatter (VAHR 7721-1435) was merged with this site. This Aboriginal place lies on a volcanic plain and ridge, immediately west of the embankment leading down to Bruce Creek. Most of the artefacts were found within the compact brown sandy silt topsoil layer, however some artefacts were found within the brown sandy silt intermediate layer, characterised by pebble or ironstone buckshot inclusions. It is possible that disturbance has allowed artefacts to shift within the deposit. Overall, the place has poor contextual integrity and there was evidence of some ground disturbance by rabbit burrowing, erosion along the creek embankment, agricultural practices such as ploughing and livestock grazing, and by the construction of a house and garden.

VAHR 7721-1435 has been registered as an artefact scatter. The artefact assemblage is large, consisting of two hundred and seventy quartz, quartzite, silcrete, and glass artefacts. The high density of artefacts exhibiting evidence of both stone tool manufacture (cores, angular fragments) and subsistence activities (formal tool types, retouch, use-wear) suggests that the site was visited numerous times and may have been a place of prolonged habitation or 'base camp' (see Holdaway and Stern 2004: 53). However, it is likely that water erosion, animal disturbance and agricultural activities have caused some of the artefacts, at least, to have shifted within the sandy silt making it unlikely that all of the artefacts were recorded *in situ*.

The single flaked glass artefact found within MTP59 indicates Aboriginal presence in the area from at least the contact-period and may also show evidence of interaction between Aboriginals and Europeans in the area.

### 10.2.3 Results of the Artefact Analysis

The stone artefact assemblage that makes up Bruces Creek Artefact Scatter (VAHR 7721-1435) consists of two hundred and seventy quartz, quartzite, silcrete, and glass artefacts. The largest number of artefacts were made from quartz ( $n=167$ ) which would have been common in the region. The results are consistent with previous assessments that indicate that quartz, quartzite and silcrete are the most common raw materials in the geographic region (e.g. Marshall and Hyett 2007; Bullers et al. 2014).

Quartz is a difficult raw material to work with due to natural imperfections in the crystalline structure which make breakage patterns often unpredictable (Holdaway & Stern 2004: 24). Nevertheless, it is common in Aboriginal stone tool assemblages for its ability to form durable sharp edges with little effort.

Quartzite is a quartz-rich sandstone that has been recrystallized by heat and/or pressure. It is also a commonly occurring raw material in stone tool assemblages in the region. Fine-grained varieties are better suited to knapping than coarser-grained varieties which produce irregular breakage patterns (Holdaway & Stern 2004: 24).

Silcrete, another commonly occurring raw material in Aboriginal stone tool assemblages, varies in texture and thus varies in suitability for knapping. According to Holdaway and Stern (2004), coarser-grained silcretes generally produce 'more durable edges', although they are likely to be less sharp than those 'produced from finer-grained varieties' (Holdaway and Stern 2004: 24).

Flaked glass is a common occurrence in post-contact Aboriginal archaeological sites (Gibbs and Harrison 2008). Often, flaked glass was used as a substitute for traditional lithic raw materials in the post-contact years, and while they sometimes show similar retouch characteristics to stone tools, non-retouched shards were also sometimes utilised (see Loy and Wolski 1999: 66). Veth and O'Connor (2005) have highlighted that more attention to these artefacts has the potential to reveal the complex social structure of post-contact settlements and show continuities in Aboriginal occupation that are often absent from the historical record.

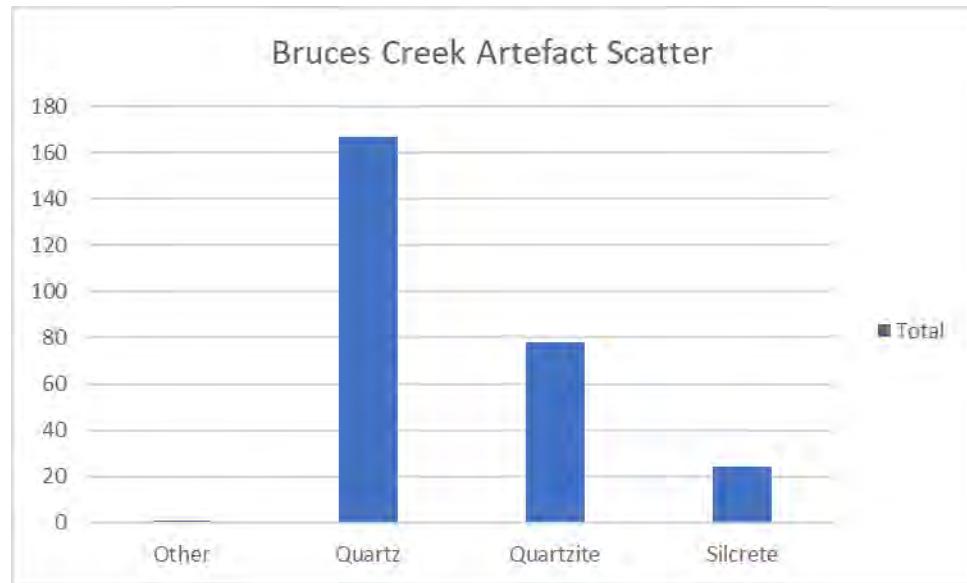

Figure 20: Raw material frequency in VAHR 7721-1435. 'Other' in this instance refers solely to glass.

All artefacts recorded during the assessment were produced using stone flaking techniques with the most common primary forms being complete flakes (n=102) and angular fragments (n=93). The high number of artefacts, particularly those related to subsistence activities and stone tool manufacture suggests that the place was likely to have been used as a place of stone tool manufacture and/or encampment.

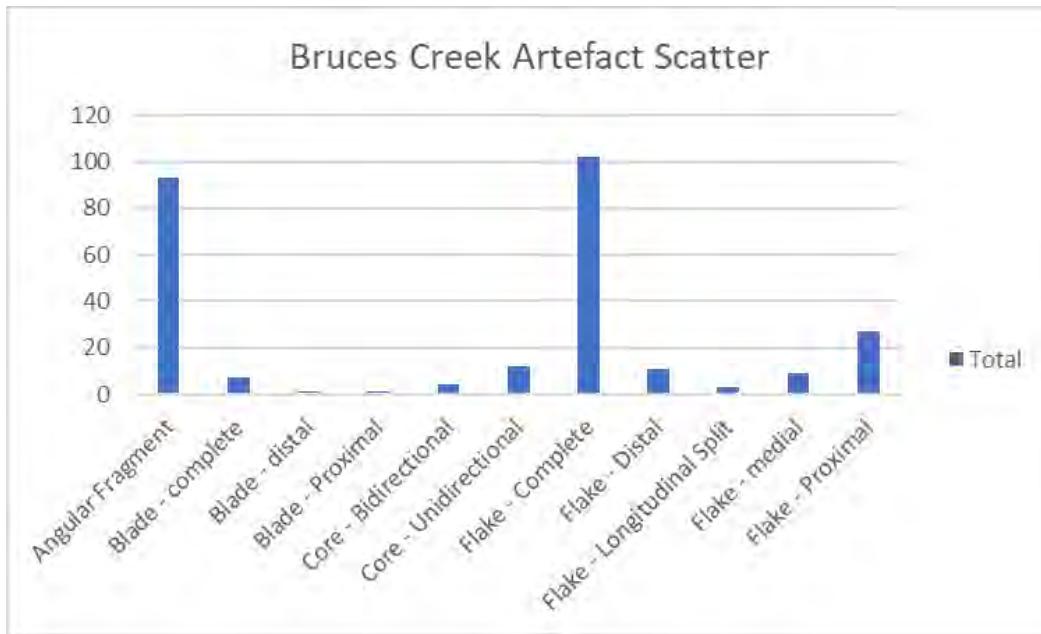

Figure 21: Primary form frequency in VAHR 7721-1435.

#### 10.2.4 Nature of Bruces Creek Artefact Scatter (VAHR 7721-1435)

Within the activity area, Bruces Creek Artefact Scatter (VAHR 7721-1435) consists of two hundred and seventy quartz, quartzite, silcrete and glass artefacts found in both surface and subsurface test pits. The scatter is located within Section 4 of the Activity Area, on a volcanic plain and ridge, immediately west of the embankment leading down to Bruce Creek. Most of the artefacts were found within the brown sandy silt topsoil layer, however some artefacts were found within the brown sandy silt intermediate layer, characterised by pebble or ironstone buckshot inclusions. Overall, the place has poor contextual integrity and there was evidence of some ground disturbance by erosion and agricultural practices such as ploughing. Disturbance caused by humans and animals while the artefacts were on the surface is also likely to have occurred.

#### 10.2.5 Extent of Bruce's Creek Artefact Scatter (VAHR 7721-1435)

The extent is based on landform and encompasses the southern slopes leading down to Bruce Creek and includes the area from just inside the 100m contour line down to the bank of the creek. The northern boundary is defined by the extent defined in report 10068, place 7721-0835, to which this place is merging. The southern boundary is defined by the property boundary and Ormond Street as testing could not occur outside the activity area. If Aboriginal cultural heritage is present to the south it will likely be located on the ridgeline along Bruce Creek. The western boundary is defined by Ormond Street. Artefacts identified further west of the boundary should be interpreted as a distinct place, as it is a separate landform to the ridge leading to Bruce Creek. The eastern extent is defined by Bruce Creek. No places have been previously registered on the eastern side of Bruce Creek and the landform is comprised of a very steep slope.

## 10.2.6 Significance of Bruces Creek Artefact Scatter (VAHR 7721-1435)

### Significance Criteria

Aboriginal Cultural Heritage Places that are represented by archaeological features and deposits are a non-renewable resource. For most areas of Victoria, archaeology is one of the few sources of historical information on the Aboriginal peoples that occupied the land prior to European settlement. Section 4 of the *Aboriginal Heritage Act 2006* includes archaeological, anthropological, contemporary, historical, scientific and social or spiritual significance values in its definition of cultural heritage significance.

### Scientific and Archaeological Values and Significance

Scientific or archaeological significance measures importance according to a number of criteria such as type, artefact density, and potential to provide information of scientific or educational value. Some archaeological sites, by their contents or antiquity, automatically attain a high degree of significance. For others, significance is based on their value as representative examples of types within a given geographical area or environmental context, or their rarity within an area. In assessing the degree of significance of a Place it is necessary to consider four comparative criteria (Russell and Winkworth 2010:10):

- Provenance;
- Rarity or representativeness;
- Condition or completeness;
- Interpretive capacity.

Scientific Significance is ranked according to the following categories or combination of categories:

- High;
- Medium;
- Low; or
- None.

High Scientific Significance means that the Place has good contextual integrity, has demonstrated or potentially demonstrates high values for research potential or comparative ability. A Place assessed to have no Scientific Significance is usually allocated to Places that have no contextual integrity, the provenance is poor or has been disturbed to such an extent that the information value has been removed or modified.

The criteria used to assess Scientific Significance are not standards that can necessarily be measured in a scientific fashion. They are relative estimates based on the current state of knowledge of the archaeology within the general region and within the specific area under consideration.

### **Statement of Scientific Significance**

Bruces Creek Artefact Scatter VAHR 7721-1435 has been assessed as having medium scientific significance or potential, given the high density and location of the artefacts.

Many archaeological studies and CHMPs have occurred in the geographic region resulting in the registration of ninety-one Aboriginal cultural places. Low density artefact scatters are the most common registered place-type in the geographic region, making up fifty-nine of ninety places. In addition, most of the previous CHMPs in the geographic region have resulted in the identification of stone artefacts which suggests that they are common in the region.

The condition or completeness of the place is poor, with evidence of ground disturbance from previous land-use activities. Other disturbance includes the impact of animal burrowing and natural processes, such as movement of sediments by water and bioturbation.

The interpretive capacity of the place is moderate, due to the high density of artefacts and formal tool-types, as well as the location of the place along the creek embankment. The place can also fit into a wider framework for analysing Aboriginal occupation within the wider region.

VAHR No.	Primary Coordinates MGA94 Zone 55 (Easting/ Northing)	Site Representativeness	Integrity	Research Potential	Educational Potential	Scientific Significance
7721-1435	250905/5783990	Regionally Common	Locally Common	Poor	Medium	Medium

Table 16: Significance Assessment of Bruces Creek Artefact Scatter (VAHR 7721-1435).

### **10.2.7 Cultural Significance According to Aboriginal Tradition**

No specific comments on the cultural significance of VAHR 7721-1435 were provided by the WTOAC members involved in the conduct of the assessment. However, all cultural material is significant to the Aboriginal community as it provides a tangible link to the past, a connection to country and is a non-renewable source of information about the lifestyles of the ancestors of the Wadawurrung people.

A general statement of significance for all sites from Mr Bryon Powell, former Chairperson of the Wadawurrung Traditional Owners Aboriginal Corporation is documented below:

*"All sites within the Wathaurung area are significant in cultural terms as they are a tangible link to our past and a non-renewable source of information about the lifestyle of our ancestors.*

*The cultural significance afforded to the sites by the Aboriginal community must be given a higher standing than the scientific rating as the scientific rating is based on a European perspective without due regard to the value of the Aboriginal culture as a whole."*

## 10.3 Manifold Street Artefact Scatter (VAHR 7721-1434)

The following section provides details and analysis of Aboriginal cultural heritage identified during the Complex Assessment. The Primary Grid Coordinate for Manifold Street Artefact Scatter (VAHR 7721-1434) is E:250702, N:5784370 (MGA/GDA94, Zone 55).

### 10.3.1 Artefact Analysis

Attribute and technological analyses were undertaken on the assemblage observing the typological categories prescribed by AV. The definitions and interpretation of lithics primarily followed those outlined in Holdaway and Stern (2004). The collected subsurface lithic artefacts were sorted prior to analysis. The attributes of the artefacts were recorded using electronic callipers and a DN1040 table magnifying lamp, which provided 1.75 to 4x magnification to assist in identification of use-wear, retouch, flaking scars and raw material type in the laboratory at the TerraCulture offices.

Table 17: Summary of artefact analysis from VAHR 7721-1434

### 10.3.2 Site formation processes

The stone artefacts recorded during the Standard and Complex Assessments were registered with Aboriginal Victoria as Manifold Street Artefact Scatter (VAHR 7721-1434). This Aboriginal place lies on a volcanic plain, approximately 290 metres west of Bruce Creek. All of the artefacts were found within the intermediate light greyish brown compact silty sand layer. It is likely that disturbance has allowed artefacts to shift within the deposit. Overall, the place has poor contextual integrity and there was evidence of some ground disturbance by rabbit burrowing, agricultural practices such as ploughing, viticultural practices and livestock grazing, as well as by the construction of a house, garden, and dam.

VAHR 7721-1434 has been registered as an artefact scatter, consisting of twenty-five silcrete and quartzite artefacts found within one 1m x 1m test pit and one 0.5m x 0.5m radial test pit. Due to the high density of artefacts found within close proximity to one another, homogeneity of raw material, and lack of identification of artefacts in four of the five radial test pits, it is likely that the artefacts were discarded as a single or a few discreet events. It is likely that agricultural and viticultural activities have caused some of the artefacts, however, to have shifted within the silty sand making it unlikely that the artefacts were recorded *in situ*. This makes it difficult to understand the initial site formation processes.

### 10.3.3 Results of the Artefact Analysis

The stone artefact assemblage that makes up Manifold Street Artefact Scatter (VAHR 7721-1434) consists of twenty-five artefacts made from silcrete and quartzite. The largest number of artefacts were made from silcrete (n=23) which would have been common in the region, although there is no source of silcrete within the Activity Area. The nearest known silcrete quarry is located at Maude (approximately 14km north of the Activity Area) and Sutherlands Creek (approximately 5km northeast of the Activity Area), so it is possible that it was sourced from these areas (see Light and Tuechler 2014: 53). The results are consistent with previous assessments that indicate that quartz, quartzite and silcrete are the most common raw materials in the geographic region.

Silcrete varies in texture and thus varies in suitability for knapping. According to Holdaway and Stern (2004), coarser-grained silcretes generally produce ‘more durable edges’, although they are likely to be less sharp than those ‘produced from finer-grained varieties’ (Holdaway and Stern 2004: 24).

Quartzite is a quartz-rich sandstone that has been recrystallized by heat and/or pressure. It is also a commonly occurring raw material in stone tool assemblages in the region. Fine-grained varieties are

better suited to knapping than coarser-grained varieties which produce irregular breakage patterns (Holdaway & Stern 2004: 24).

Figure 22: Raw material frequency in VAHR 7721-1434.

All artefacts recorded during the assessment were produced using stone flaking techniques with the most common primary forms being complete flakes and complete blades. The high presence of cores ( $n=3$ ) relative to the number angular fragments and flakes suggests that the place was likely the location of a single knapping event, rather than a place of large-scale stone tool manufacture or encampment.

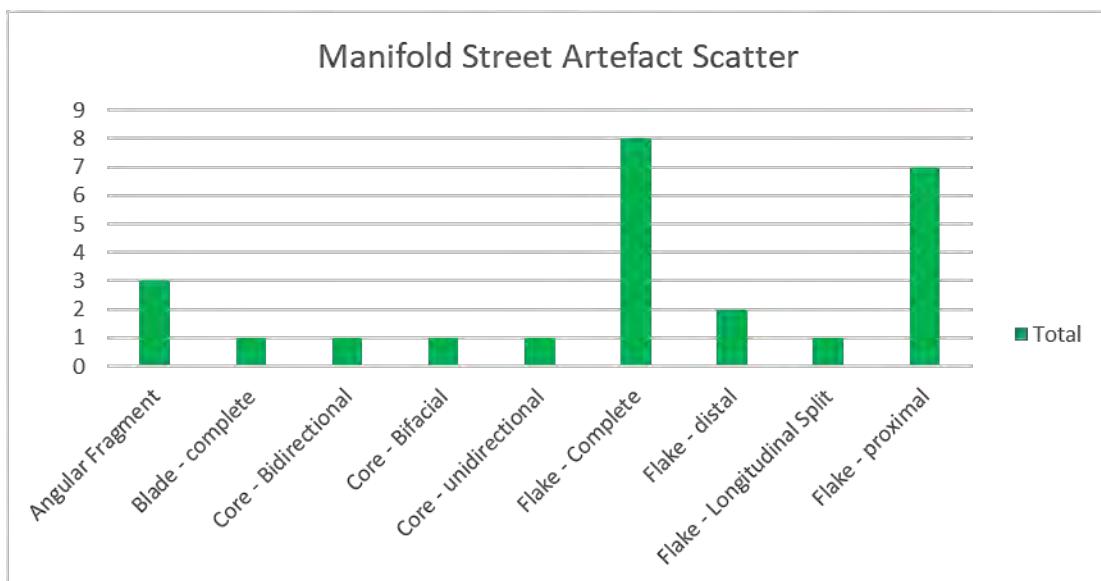

Figure 23: Primary form frequency in VAHR 7721-1434.

#### **10.3.4 Nature of Manifold Street Artefact Scatter (VAHR 7721-1434)**

Within the Activity Area, Manifold Street Artefact Scatter (VAHR 7721-1434) consists of twenty-five silcrete and quartzite artefacts found in subsurface test pits. The scatter is located within Section 1 of the Activity Area, in a flat volcanic plain approximately 290 metres west of Bruce Creek. All of the artefacts were found within the intermediate light greyish brown silty sand layer, at depths of between 150-250mm. Overall, the place has very poor contextual integrity and there was evidence of major ground disturbance by agricultural and viticultural practices such as ploughing. Disturbance caused by humans and animals while the artefacts were on the surface is also likely to have occurred.

Photograph 66: Silcrete artefacts from TP4, 20cm depth

Photograph 67: Close-up of silcrete core from TP4, 20cm depth

Photograph 68: Backed geometric microlith from TP4, 15cm depth

Photograph 69: Silcrete flake from TP4, 15cm depth

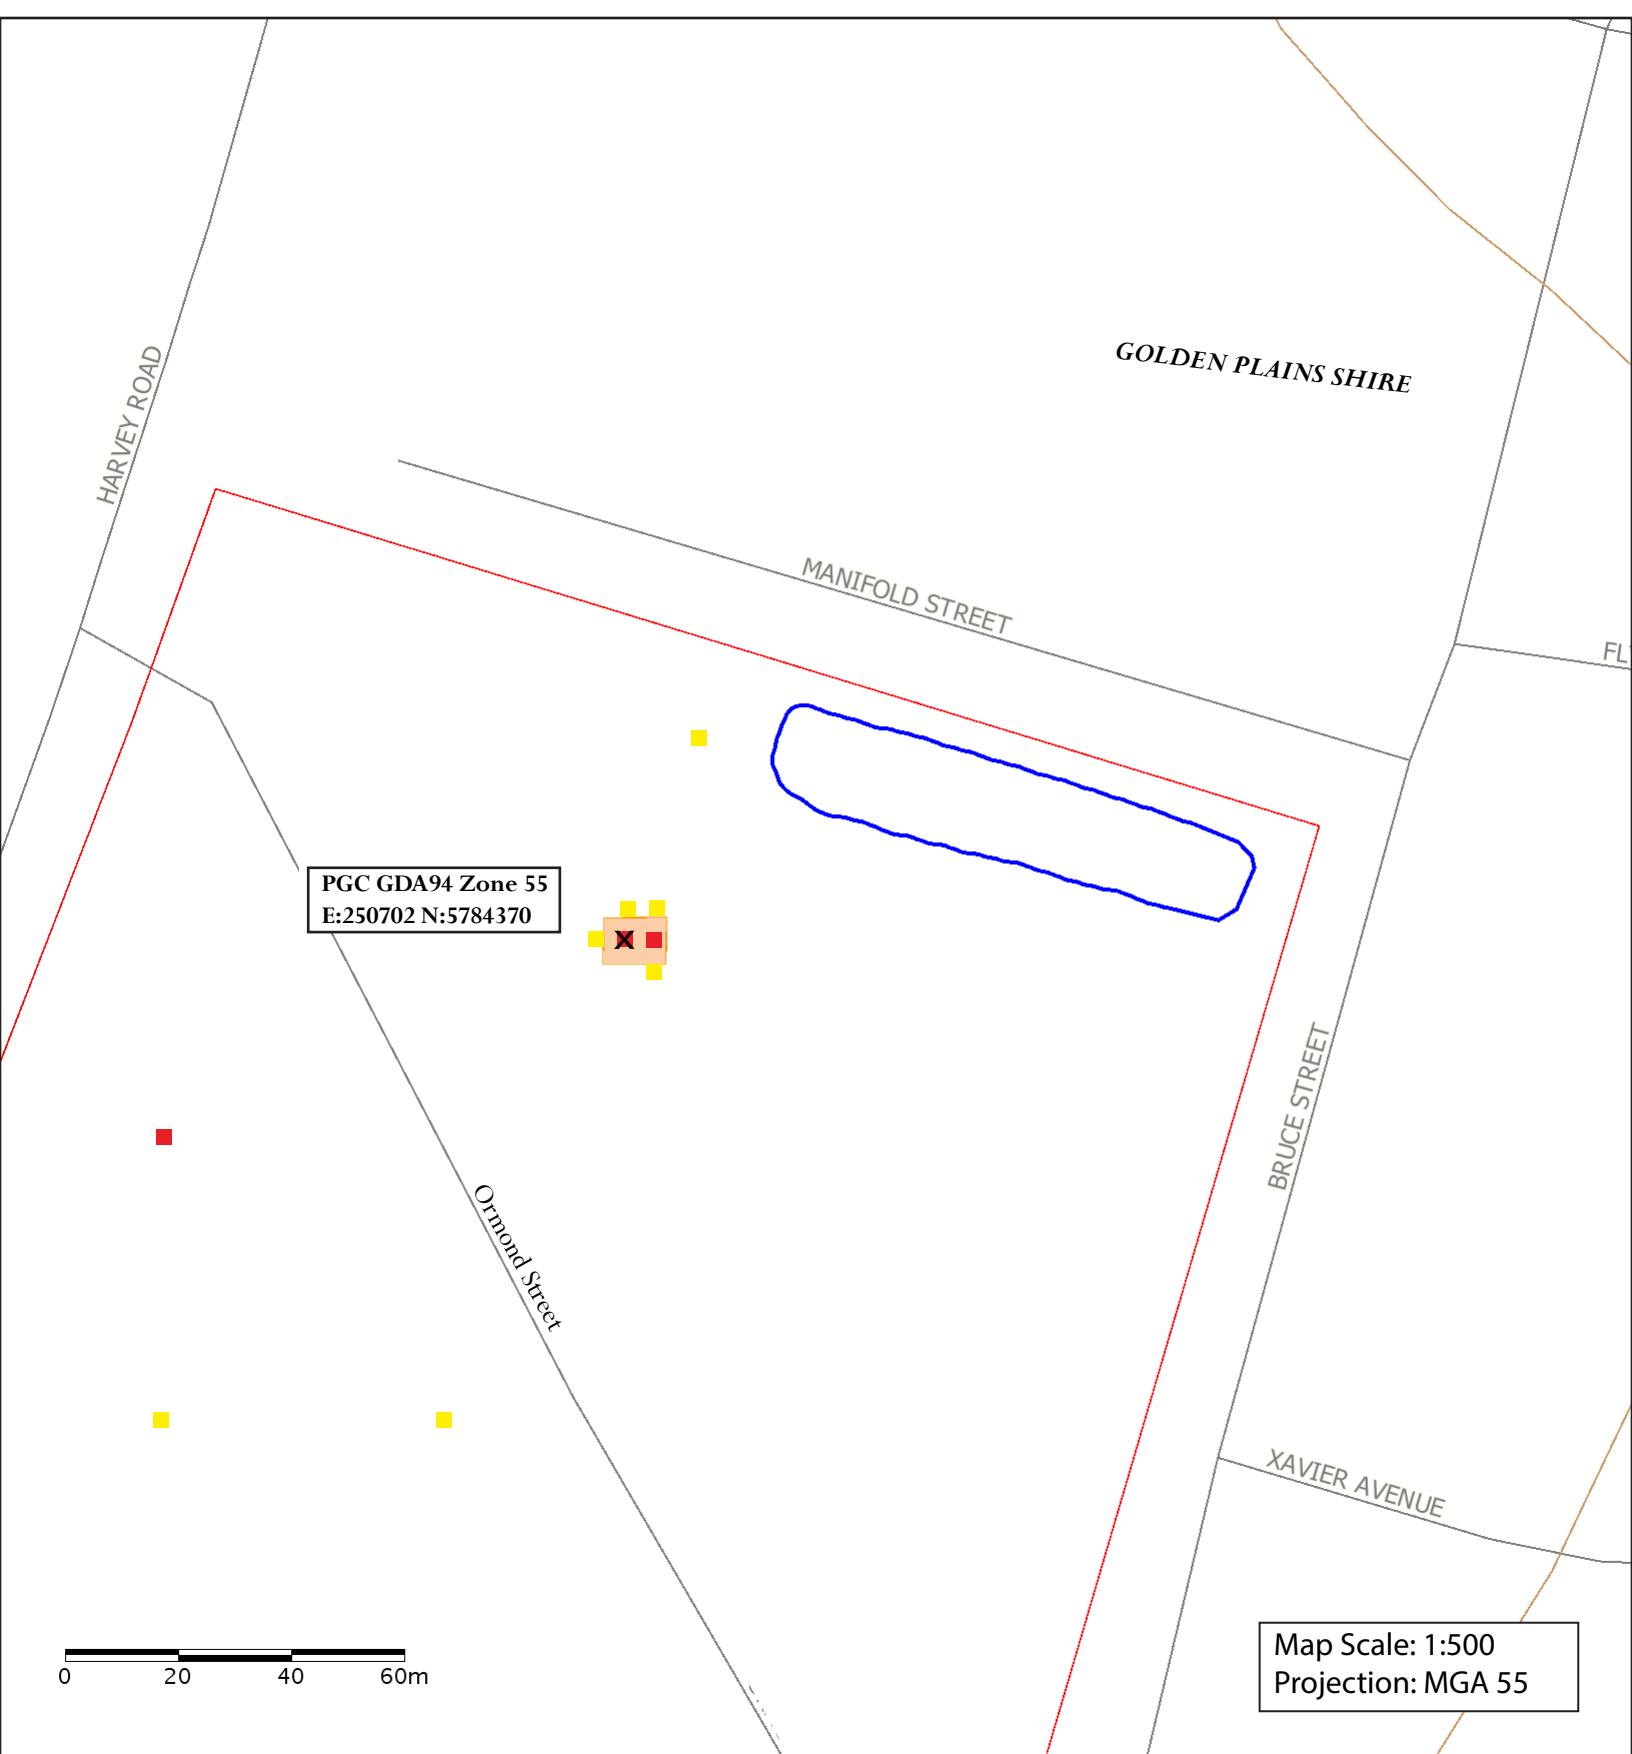

Photograph 70: Quartzite flakes from TP4.3, 25cm depth

### 10.3.5 Extent of Manifold Street Artefact Scatter (VAHR 7721-1434)

The extent is based on radial subsurface testing that was undertaken during the Complex Assessment of CHMP 15813. The extent encompasses the two positive test pits (TP4 and RTP4.3) and is defined to the north, south and west by the presence of negative test pits. The eastern boundary is defined by a vineyard which has caused disturbance to the landform through viticultural practices.

### 10.3.6 Significance of Manifold Street Artefact Scatter (VAHR 7721-1434)

#### Significance Criteria

Aboriginal Cultural Heritage Places that are represented by archaeological features and deposits are a non-renewable resource. For most areas of Victoria, archaeology is one of the few sources of historical information on the Aboriginal peoples that occupied the land prior to European settlement. Section 4 of the *Aboriginal Heritage Act 2006* includes archaeological, anthropological, contemporary, historical, scientific and social or spiritual significance values in its definition of cultural heritage significance.

#### Scientific and Archaeological Values and Significance

Scientific or archaeological significance measures importance according to a number of criteria such as type, artefact density, and potential to provide information of scientific or educational value. Some archaeological sites, by their contents or antiquity, automatically attain a high degree of significance. For others, significance is based on their value as representative examples of types within a given geographical area or environmental context, or their rarity within an area. In assessing the degree of significance of a Place it is necessary to consider four comparative criteria (Russell and Winkworth 2010:10):

- Provenance;
- Rarity or representativeness;
- Condition or completeness;
- Interpretive capacity.

Scientific Significance is ranked according to the following categories or combination of categories:

- High;
- Medium;
- Low; or
- None.

High Scientific Significance means that the Place has good contextual integrity, has demonstrated or potentially demonstrates high values for research potential or comparative ability. A Place assessed to have no Scientific Significance is usually allocated to Places that have no contextual integrity, the provenance is poor or has been disturbed to such an extent that the information value has been removed or modified.

The criteria used to assess Scientific Significance are not standards that can necessarily be measured in a scientific fashion. They are relative estimates based on the current state of knowledge of the archaeology within the general region and within the specific area under consideration.

#### **Statement of Scientific Significance**

Manifold Street Artefact Scatter VAHR 7721-1434 has been assessed as having low scientific significance or potential, given the density of artefacts, the integrity of the site and the commonness of the place within the geographic region.

Many archaeological studies and CHMPs have occurred in the geographic region resulting in the registration of ninety-one Aboriginal cultural places. Low density artefact scatters are the most common registered place-type in the geographic region, making up fifty-nine of ninety places. In addition, most of the previous CHMPs in the geographic region have resulted in the identification of stone artefacts which suggests that they are common in the region.

The condition or completeness of the place is poor, with evidence of ground disturbance from previous land-use activities. Other disturbance includes the impact of animal burrowing and natural processes, such as movement of sediments by water and bioturbation.

The interpretive capacity of the place is low, due to the low density of artefacts making it difficult to complete meaningful statistical analysis, and the previous disturbance of the landform. However, the place can be fit into a wider framework for analysing Aboriginal occupation within the wider region.

VAHR No.	Primary Coordinates	Site Representativeness	Integrity	Research Potential	Educational Potential	Scientific Significance
7721-1434	MGA94 Zone 55 (Easting/ Northing)	250702/5784370	Regionally Common	Locally Common	Poor	Poor

Table 18: Significance Assessment of Manifold Street Artefact Scatter (VAHR 7721-1434).

#### **10.3.7 Cultural Significance According to Aboriginal Tradition**

No specific comments on the cultural significance of VAHR 7721-1434 were provided by the WTOAC members involved in the conduct of the assessment. However, all cultural material is significant to the Aboriginal community as it provides a tangible link to the past, a connection to country and is a non-renewable source of information about the lifestyles of the ancestors of the Wadawurrung people.

A general statement of significance for all sites from Mr Bryon Powell, former Chairperson of the Wadawurrung Traditional Owners Aboriginal Corporation is documented below:

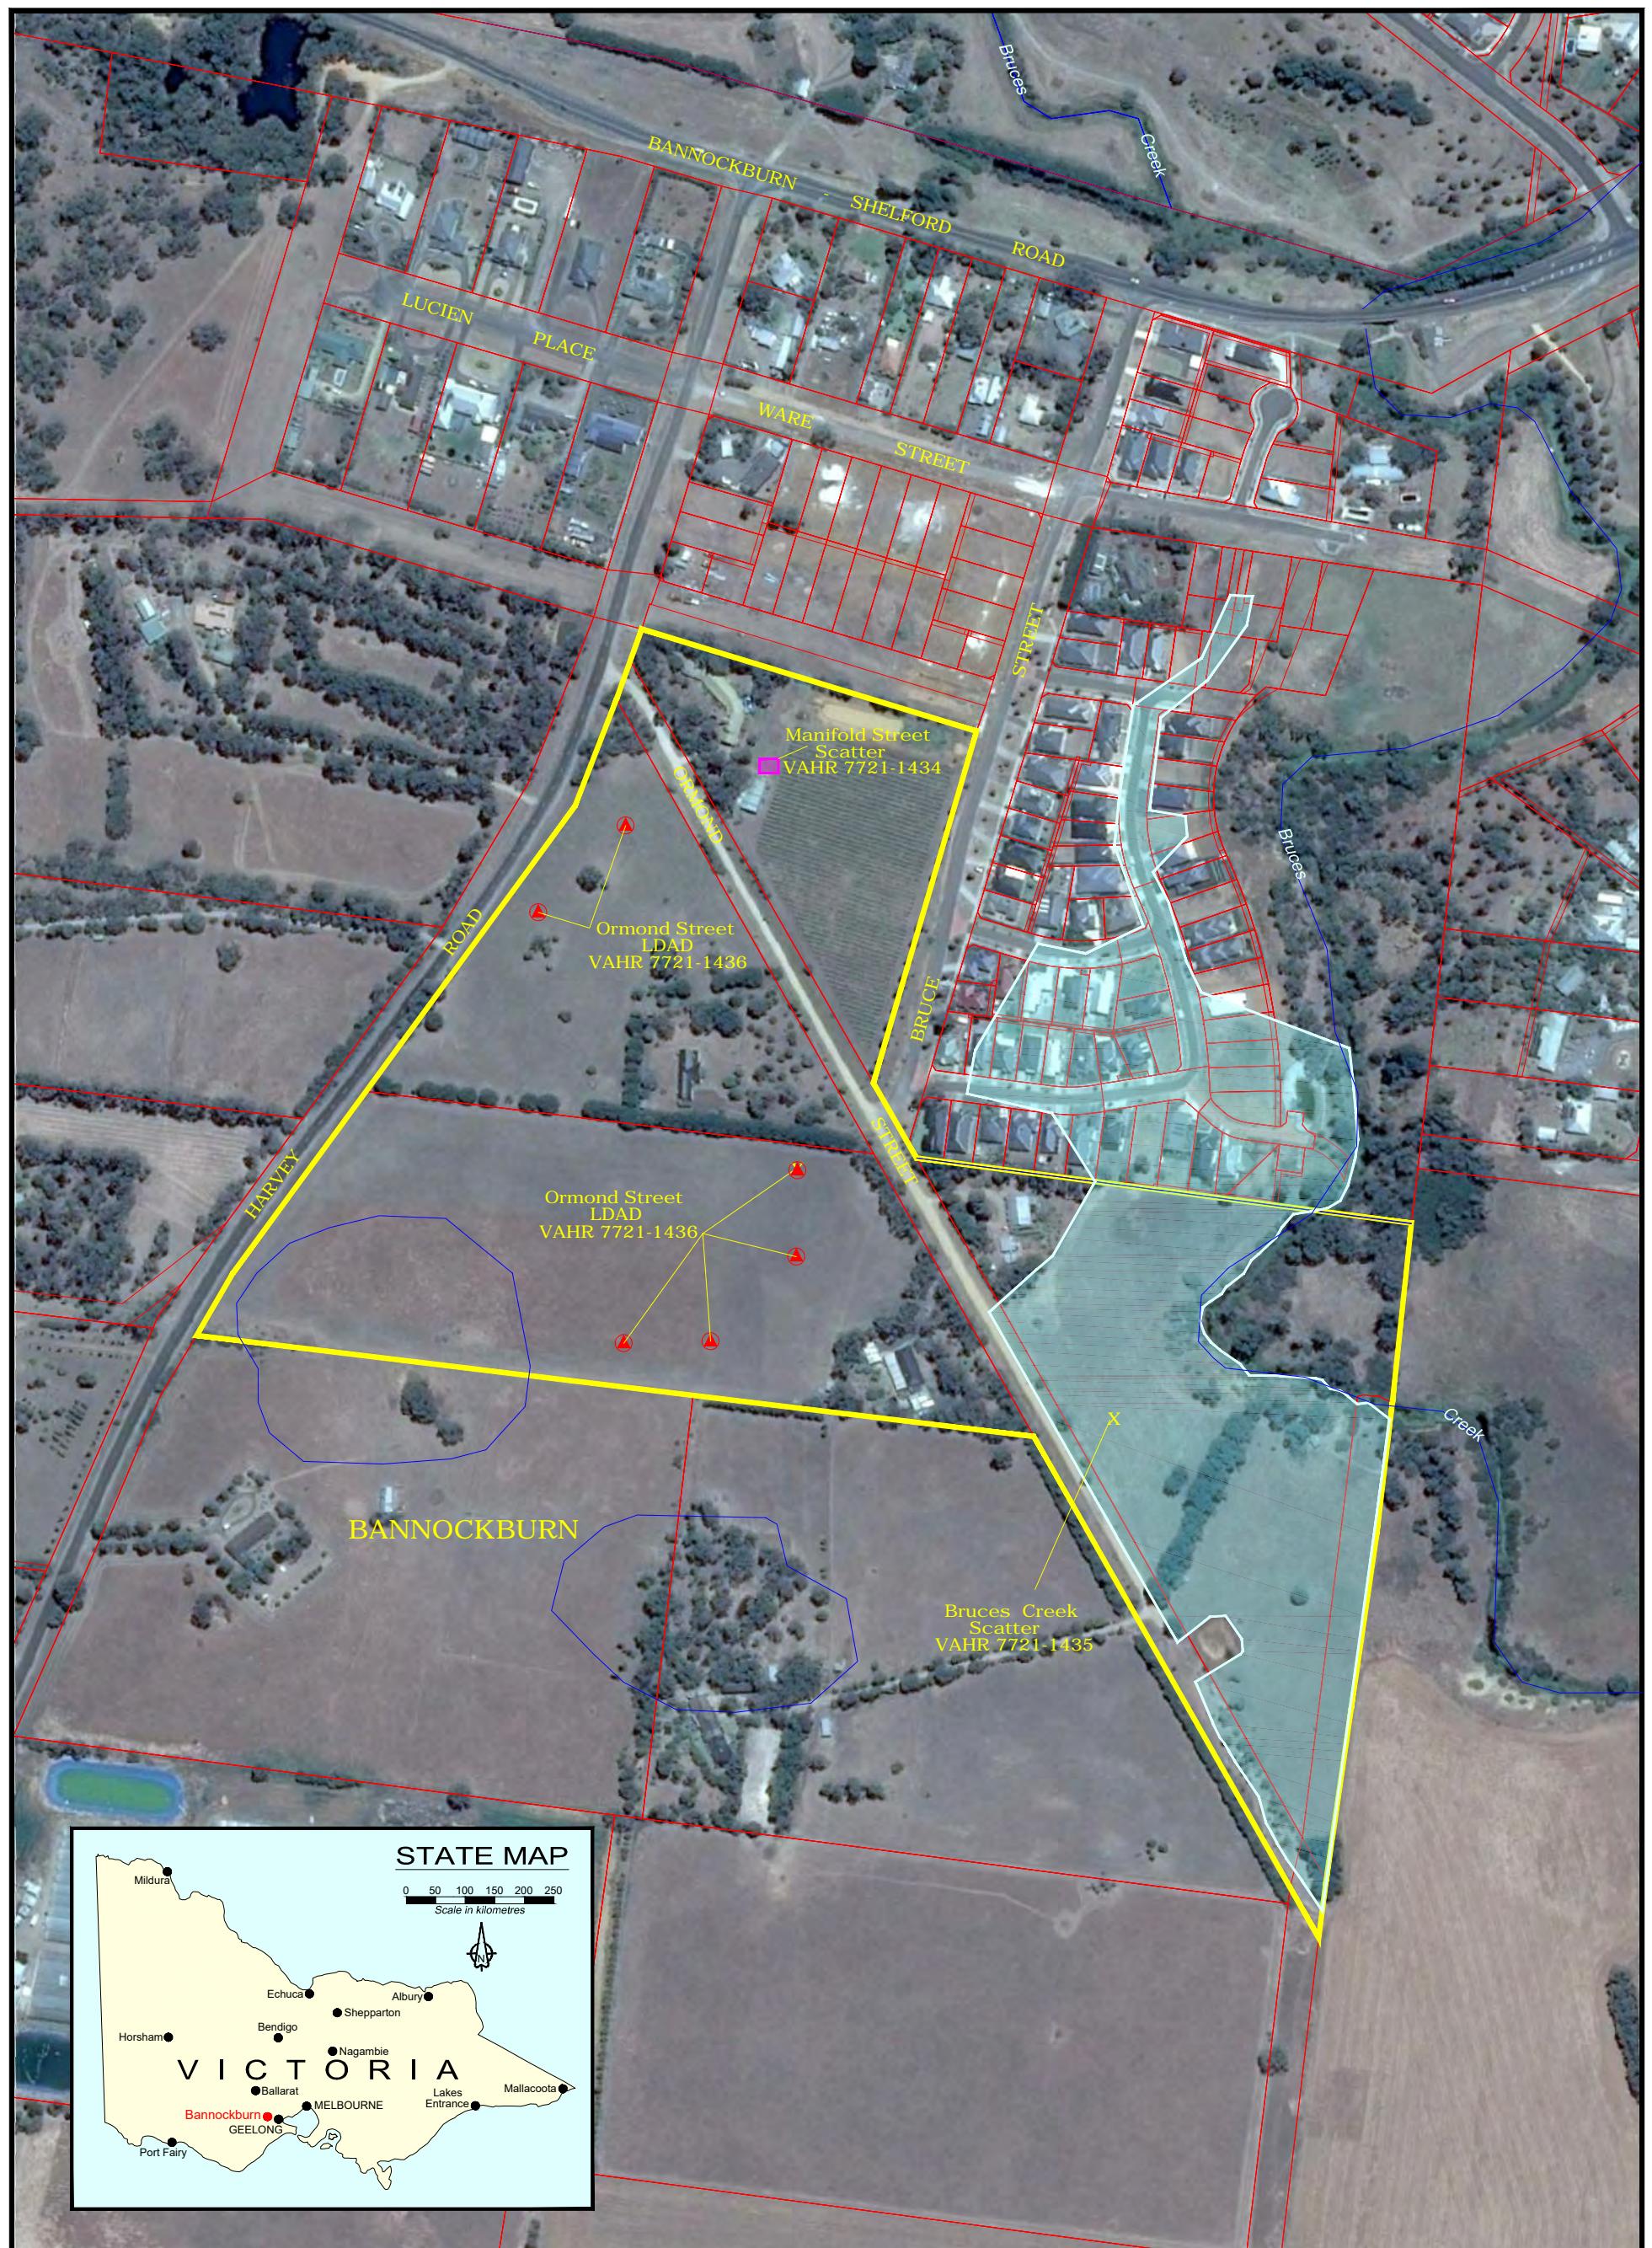

*"All sites within the Wathaurung area are significant in cultural terms as they are a tangible link to our past and a non-renewable source of information about the lifestyle of our ancestors.*

*The cultural significance afforded to the sites by the Aboriginal community must be given a higher standing than the scientific rating as the scientific rating is based on a European perspective without due regard to the value of the Aboriginal culture as a whole."*

## **10.4 Conclusions of Aboriginal Cultural Heritage Assessment**

Three new Aboriginal cultural heritage places were identified within the activity area during the current assessment, consisting of two artefact scatters and one low density artefact distributions. The places were registered as Ormond Street LDAD (VAHR 7721-1436), Bruces Creek Artefact Scatter (VAHR 7721-1435), and Manifold Street Artefact Scatter (VAHR 7721-1434).

Bruges Creek Artefact Scatter (VAHR 7721-1435) was assessed as having medium scientific significance due to the high density of artefacts and its location relative to Bruce Creek. The remaining places were assessed as having low scientific significance due to the relatively low density of artefacts, the poor integrity of the places and the commonness of the place types in the geographic region. However, all cultural material is significant to the Aboriginal community as it provides a tangible link to the past, a connection to country and is a non-renewable source of information about the lifestyles of the ancestors of the Wadawurrung.

MAP 9: Showing Cultural Heritage within the Activity Area.

## 11.0 Consideration of Section 61 Matters- Impact Assessment

In accordance with the *Aboriginal Heritage Act 2006* and the *Aboriginal Heritage Regulations 2018*, an assessment must be made concerning whether the proposed activity can be conducted in a way that avoids harm to Aboriginal cultural heritage, or in a way that minimises harm to Aboriginal cultural heritage.

### 11.1 Impact on Ormond Street LDAD (VAHR 7721-1436)

This section assesses the impact of the proposed activity on the Ormond Street LDAD (VAHR 7721-1436).

#### 11.1.1 Can Harm be Avoided?

The components of the place within the Activity Area are located in soils at depths ranging from approximately 15cm. Due to the nature and impact of the proposed activity it is not possible to avoid harm to the place.

#### 11.1.2 Can Harm be Minimised?

The proposed activity involves excavation to depths of over 15cm across the entire Activity Area. Therefore, harm to the place cannot be minimised.

### 11.2 Specific Measures Needed for the Protection of Ormond Street LDAD (VAHR 7721-1436)

#### 11.2.1 Inductions

Cultural heritage inductions will be conducted for all personnel involved in ground disturbance works. The inductions will provide information relating to the identification of Aboriginal artefacts, the deposits in which they may occur and explain the conditions and contingencies of the management plan, including what to do if suspected Aboriginal cultural heritage is identified. The details of the cultural heritage inductions are provided in Part 1 Section 1.1.2 of this CHMP.

### **11.2.2 Compliance Inspections**

Three compliance checks will take place before commencement, during the activity and following the completion of the activity for the purpose of ensuring compliance with the CHMP. The details of the compliance inspections are presented in Part 1 Section 1.1.3 of this CHMP.

### **11.2.3 Repatriation**

Following the completion of the activity, all artefacts collected during the assessment of VAHR 7721-1436 will be reburied according to the policies of the WTOAC. The details of the repatriation are provided in Part 1 Section 1.2.1 of this CHMP.

## **11.3 Impact on Bruces Creek Artefact Scatter (VAHR 7721-1435)**

This section assesses the impact of the proposed activity on the Bruces Creek Artefact Scatter (VAHR 7721-1435).

### **11.3.1 Can Harm be Avoided?**

The components of the place within the Activity Area are located in soils at depths ranging from the surface and approximately 5cm. Due to the nature and impact of the proposed activity it is not possible to avoid harm to the place.

### **11.3.2 Can Harm be Minimised?**

The proposed activity involves excavation to depths of over 5cm across the entire Activity Area. Therefore, harm to the place cannot be minimised.

## **11.4 Specific Measures Needed for the Protection of Bruces Creek Artefact Scatter (VAHR 7721-1435)**

### **11.4.1 Inductions**

Cultural heritage inductions will be conducted for all personnel involved in ground disturbance works. The inductions will provide information relating to the identification of Aboriginal artefacts, the deposits in which they may occur and explain the conditions and contingencies of the management plan, including what to do if suspected Aboriginal cultural heritage is identified. The details of the cultural heritage inductions are provided in Part 1 Section 1.1.2 of this CHMP.

### **11.4.2 Compliance Inspections**

Three compliance checks will take place before commencement, during the activity and following the completion of the activity for the purpose of ensuring compliance with the CHMP. The details of the compliance inspections are presented in Part 1 Section 1.1.3 of this CHMP.

### **11.4.3 Salvage Excavations**

Prior to the commencement of the activity, archaeological salvage excavations will be conducted for VAHR 7721-1435. The aim of the salvage is to recover the Aboriginal cultural heritage associated with this place in order to mitigate harm from the proposed activity and allow for the reburial of the artefacts. The details of the salvage excavations are provided in Part 1 Section 1.3.1 of this CHMP.

### **11.4.4 Repatriation**

Following the completion of the activity, all artefacts collected during the assessment and salvage of VAHR 7721-1435 will be reburied according to the policies of the WTOAC. The details of the repatriation are provided in Part 1 Section 1.3.2 of this CHMP.

## **11.5 Impact on Manifold Street Artefact Scatter (VAHR 7721-1434)**

This section assesses the impact of the proposed activity on the Manifold Street Artefact Scatter (VAHR 7721-1434).

### **11.5.1 Can Harm be Avoided?**

The components of the place within the Activity Area are located in soils at depths ranging from approximately 15cm. Due to the nature and impact of the proposed activity it is not possible to avoid harm to the place.

### **11.5.2 Can Harm be Minimised?**

The proposed activity involves excavation to depths of over 15cm across the entire Activity Area. Therefore, harm to the place cannot be minimised.

## 11.6 Specific Measures Needed for the Protection of Manifold Street Artefact Scatter (VAHR 7721-1434)

### 11.6.1 Inductions

Cultural heritage inductions will be conducted for all personnel involved in ground disturbance works. The inductions will provide information relating to the identification of Aboriginal artefacts, the deposits in which they may occur and explain the conditions and contingencies of the management plan, including what to do if suspected Aboriginal cultural heritage is identified. The details of the cultural heritage inductions are provided in Part 1 Section 1.1.2 of this CHMP.

### 11.6.2 Compliance Inspections

Three compliance checks will take place before commencement, during the activity and following the completion of the activity for the purpose of ensuring compliance with the CHMP. The details of the compliance inspections are presented in Part 1 Section 1.1.3 of this CHMP.

### 11.6.3 Repatriation

Following the completion of the activity, all artefacts collected during the assessment and salvage of VAHR 7721-1434 will be reburied according to the policies of the WTOAC. The details of the repatriation are provided in Part 1 Section 1.4.1 of this CHMP.

## 11.7 Cumulative Impacts of the Activity on Aboriginal Cultural Heritage in the Region

Artefact scatters and low-density artefact distributions are common in the geographic region with a total of 27 artefact scatters and 59 LDAD components previously identified. Previous development in the geographic region has caused the destruction of many of the Aboriginal Cultural Heritage Places recorded as part of CHMPs. However, a large amount of the region remains rural/semi-rural, meaning that unrecorded artefact scatters are highly likely to be present.

The proposed activity will cause harm to Ormond Street LDAD (VAHR 7721-1436), Bruces Creek Artefact Scatter (VAHR 7721-1435), and Manifold Street Artefact Scatter (VAHR 7721-1434). However, the reburial of Aboriginal cultural heritage recovered during the assessment and subsequent salvage within a designated area of public open space will ensure that harm to these places is mitigated and the area

maintains a connection to the Aboriginal community.

It is recommended that future CHMPs in the Golden Plains region emphasise the importance of retaining Aboriginal cultural heritage to minimise the impacts from future developments.

## 11.8 Contingency Plans

Relevant contingency plans for this Activity Area are detailed in Part 1 Section 2.0 of this report. They include the following:

- Section 61 Matters (Section 2.1);
- Dispute resolution (Section 2.2);
- Discovery of Aboriginal human remains during the activity (Section 2.3);
- Discovery of Aboriginal cultural heritage during the activity (Section 2.4);
- Protocol for handling sensitive information (Section 2.5);
- Reporting discovery of Aboriginal cultural heritage during works (Section 2.6); and
- Reviewing compliance (Section 2.7).

## 11.9 Custody and Management Arrangements

The reburial of artefacts must be undertaken in accordance with the following WTOAC standard procedures:

- a) Cultural material to be reburied must be placed in a durable container manufactured by the WTOAC;
- b) A separate container is to be manufactured for each Aboriginal Place to be reburied;
- c) Where an Aboriginal Place is comprised of a large amount of cultural material it will be necessary to manufacture a number of containers to rebury the cultural material;
- d) The contents of the container must include the cultural material to be reburied, a catalogue of the cultural material to be reburied on both paper and on an archive quality storage medium, a copy of the relevant sections of the CHMP under which the reburial is being performed and a handful of soil from the Aboriginal Place from which the cultural material originated;
- e) The reburial must be attended by a Wadawurrung Traditional Owner and a representative;
- f) A smoking ceremony must be performed prior to the reburial of cultural material;
- g) Flagging tape must be laid within the hole at a depth of 300mm above the reburied cultural material to identify that cultural material is buried below the flagging tape;

- h) Once reburied, the reburial location must be recorded to sub-metre accuracy by the HA and be relocatable;
- i) The relevant VAHR site record card must be updated by submitting an Object Collection component form with the reburial location details. This must be completed by the HA and lodged with AV;
- j) Following the reburial, interpretive signage must be placed within the activity area. The content of that interpretive signage, the method of its construction and the location for its placement must be developed in consultation with the WTOAC; and
- k) The cost of the manufacture of the container, the analysis and preparation of the cultural material for reburial, smoking ceremony, WTOAC attendance at the reburial and any consultation with the WTOAC or materials associated with the interpretive signage must be borne by the Sponsor.

The costs associated with the recording of the reburial location and updating of the relevant VAHR site record by the HA must be borne by the Sponsor.

## Appendices

## **Appendix A: Notice of Intent and Response from the RAP**

# Notice of Intent to prepare a Cultural Heritage Management Plan for the purposes of the *Aboriginal Heritage Act 2006*

This form can be used by the Sponsor of a Cultural Heritage Management Plan to complete the notification provisions pursuant to s.54 of the *Aboriginal Heritage Act 2006* (the "Act").

For clarification on any of the following please contact Victorian Aboriginal Heritage Register (VAHR) enquiries on 1800-726-003.

## SECTION 1 - Sponsor information

Sponsor:	TGM Group Pty Ltd	
ABN/ACN:	11125568461	
Contact Name:	Chris Marshall	
Postal Address	PO Box 1137, Geelong VIC 3220	
Business Number:	5202 4600	Mobile:
Email Address:	chrism@tgmgroup.com	

## Sponsor's agent (if relevant)

Company:		
Contact Name:		
Postal Address		
Business Number:	Mobile:	
Email Address:		

## SECTION 2 - Description of proposed activity and location

Project Name:	Ormond Street Bannockburn Subdivision	
Municipal district:	Golden Plains Shire Council	

Clearly identify the proposed activity for which the cultural heritage management plan is to be prepared (ie. Mining, road construction, housing subdivision)

Subdivision

## SECTION 3 - Cultural Heritage Advisor

Catherine Webb	Terraculture Pty Ltd	cwebb@terraculture.com.au
Name	Company	Email address

## SECTION 4 - Expected start and finish date for the cultural heritage management plan

Start Date: 19-Jun-2018 Finish Date: 01-Jul-2019

Submitted on: 19 Jun 2018

## SECTION 5 - Why are you preparing this cultural heritage management plan?

- A cultural heritage management plan is required by the Aboriginal Heritage Regulations 2007

*What is the high Impact Activity as it is listed in the regulations?*

Subdivision

Is any part of the activity an area of cultural heritage sensitivity, as listed in the regulations? Yes

- Other Reasons (Voluntary)

- An Environment Effects Statement is required

- A Cultural Heritage Management Plan is required by the Minister for Aboriginal Affairs.

- An Impact Management Plan or Comprehensive Impact Statement is required for the activity

## SECTION 6 - List the relevant registered Aboriginal parties (if any)

*This section is to be completed where there are registered Aboriginal parties in relation to the management plan.*

Wathaurung Aboriginal Corporation

## SECTION 7A - List the relevant Aboriginal groups or Aboriginal people with whom the Sponsor intends to consult (if any)

*This section is to be completed only if the proposed activity in the management plan is to be carried out in an area where there is no Registered Aboriginal Party.*

## SECTION 7B - Describe the intended consultation process (if any)

*This section is to be completed only if the proposed activity in the management plan is to be carried out in an area where there is no Registered Aboriginal Party.*

## SECTION 8 – State who will be evaluating this plan (mandatory)

*The plan is to be evaluated by:*

- A Registered Aboriginal Party **AND / OR**

If checked, list the relevant Registered Aboriginal Party Evaluating: Wathaurung Aboriginal Corporation

- The Secretary **AND / OR**

- The Council

## SECTION 9 – Preliminary Aboriginal Heritage Tests (PAHTs)

*List the Reference Number(s) of any PAHTs conducted in relation to the proposed activity:*

## SECTION 10 - Notification checklist

Ensure that any relevant registered Aboriginal party/ies is also notified. A copy of this notice with a map attached may be used for this purpose.

(A registered Aboriginal party is allowed up to 14 days to provide a written response to a notification specifying whether or not it intends to evaluate the management plan.)

**In addition to notifying the Deputy Director and any relevant registered Aboriginal party/ies, a Sponsor must also notify any owner and/or occupier of any land within the area to which the management plan relates. A copy of this notice with a map attached may be used for this purpose.**

**Ensure any municipal council, whose municipal district includes an area to which the cultural heritage management plan relates, is also notified. A copy of this notice, with a map attached, may also be used for this purpose.**

Submitted on: 19 Jun 2018

## **Wathaurung Aboriginal Corporation**

ICN 3330

20<sup>th</sup> June 2018

TGM Group Pty Ltd  
Chris Marshall  
PO Box 1137  
Geelong Vic 3220

To Whom It May Concern,

### **NOTICE OF INTENT TO PREPARE A CULTURAL HERITAGE MANAGEMENT PLAN**

I am writing to acknowledge your written notice of intention to prepare a management plan, received on the 20<sup>th</sup> June 2018, Ormond Street Bannockburn Subdivision CHMP 15813.

Wathaurung Aboriginal Corporation (WAC) trading as Wadawurrung is the Registered Aboriginal Party (RAP) for the proposed activity area and will:

1. Evaluate the plan when it is completed and
2. Pursuant to s.60 of the *Aboriginal Heritage Act 2006* give notice that the WAC will do all or any of the following-
  - (a) Consult with the sponsor in relation to the assessment of the area for the purposes of the plan.
  - (b) Consult with the sponsor in relation to the conditions to be included in the plan.
  - (c) Participate in the conduct of the assessment.

To aid in the development of the CHMP, the following process is requested as a minimum:

At least one pre-planning meeting with Sponsor and Heritage Advisor to determine process and methodology.

One post-investigation meeting to develop appropriate management recommendations.

And for the evaluation of the CHMP, the following is required:

1 hard copy, 1 electronic (PDF or word) copy and full payment to the Wadawurrung Office for evaluation.

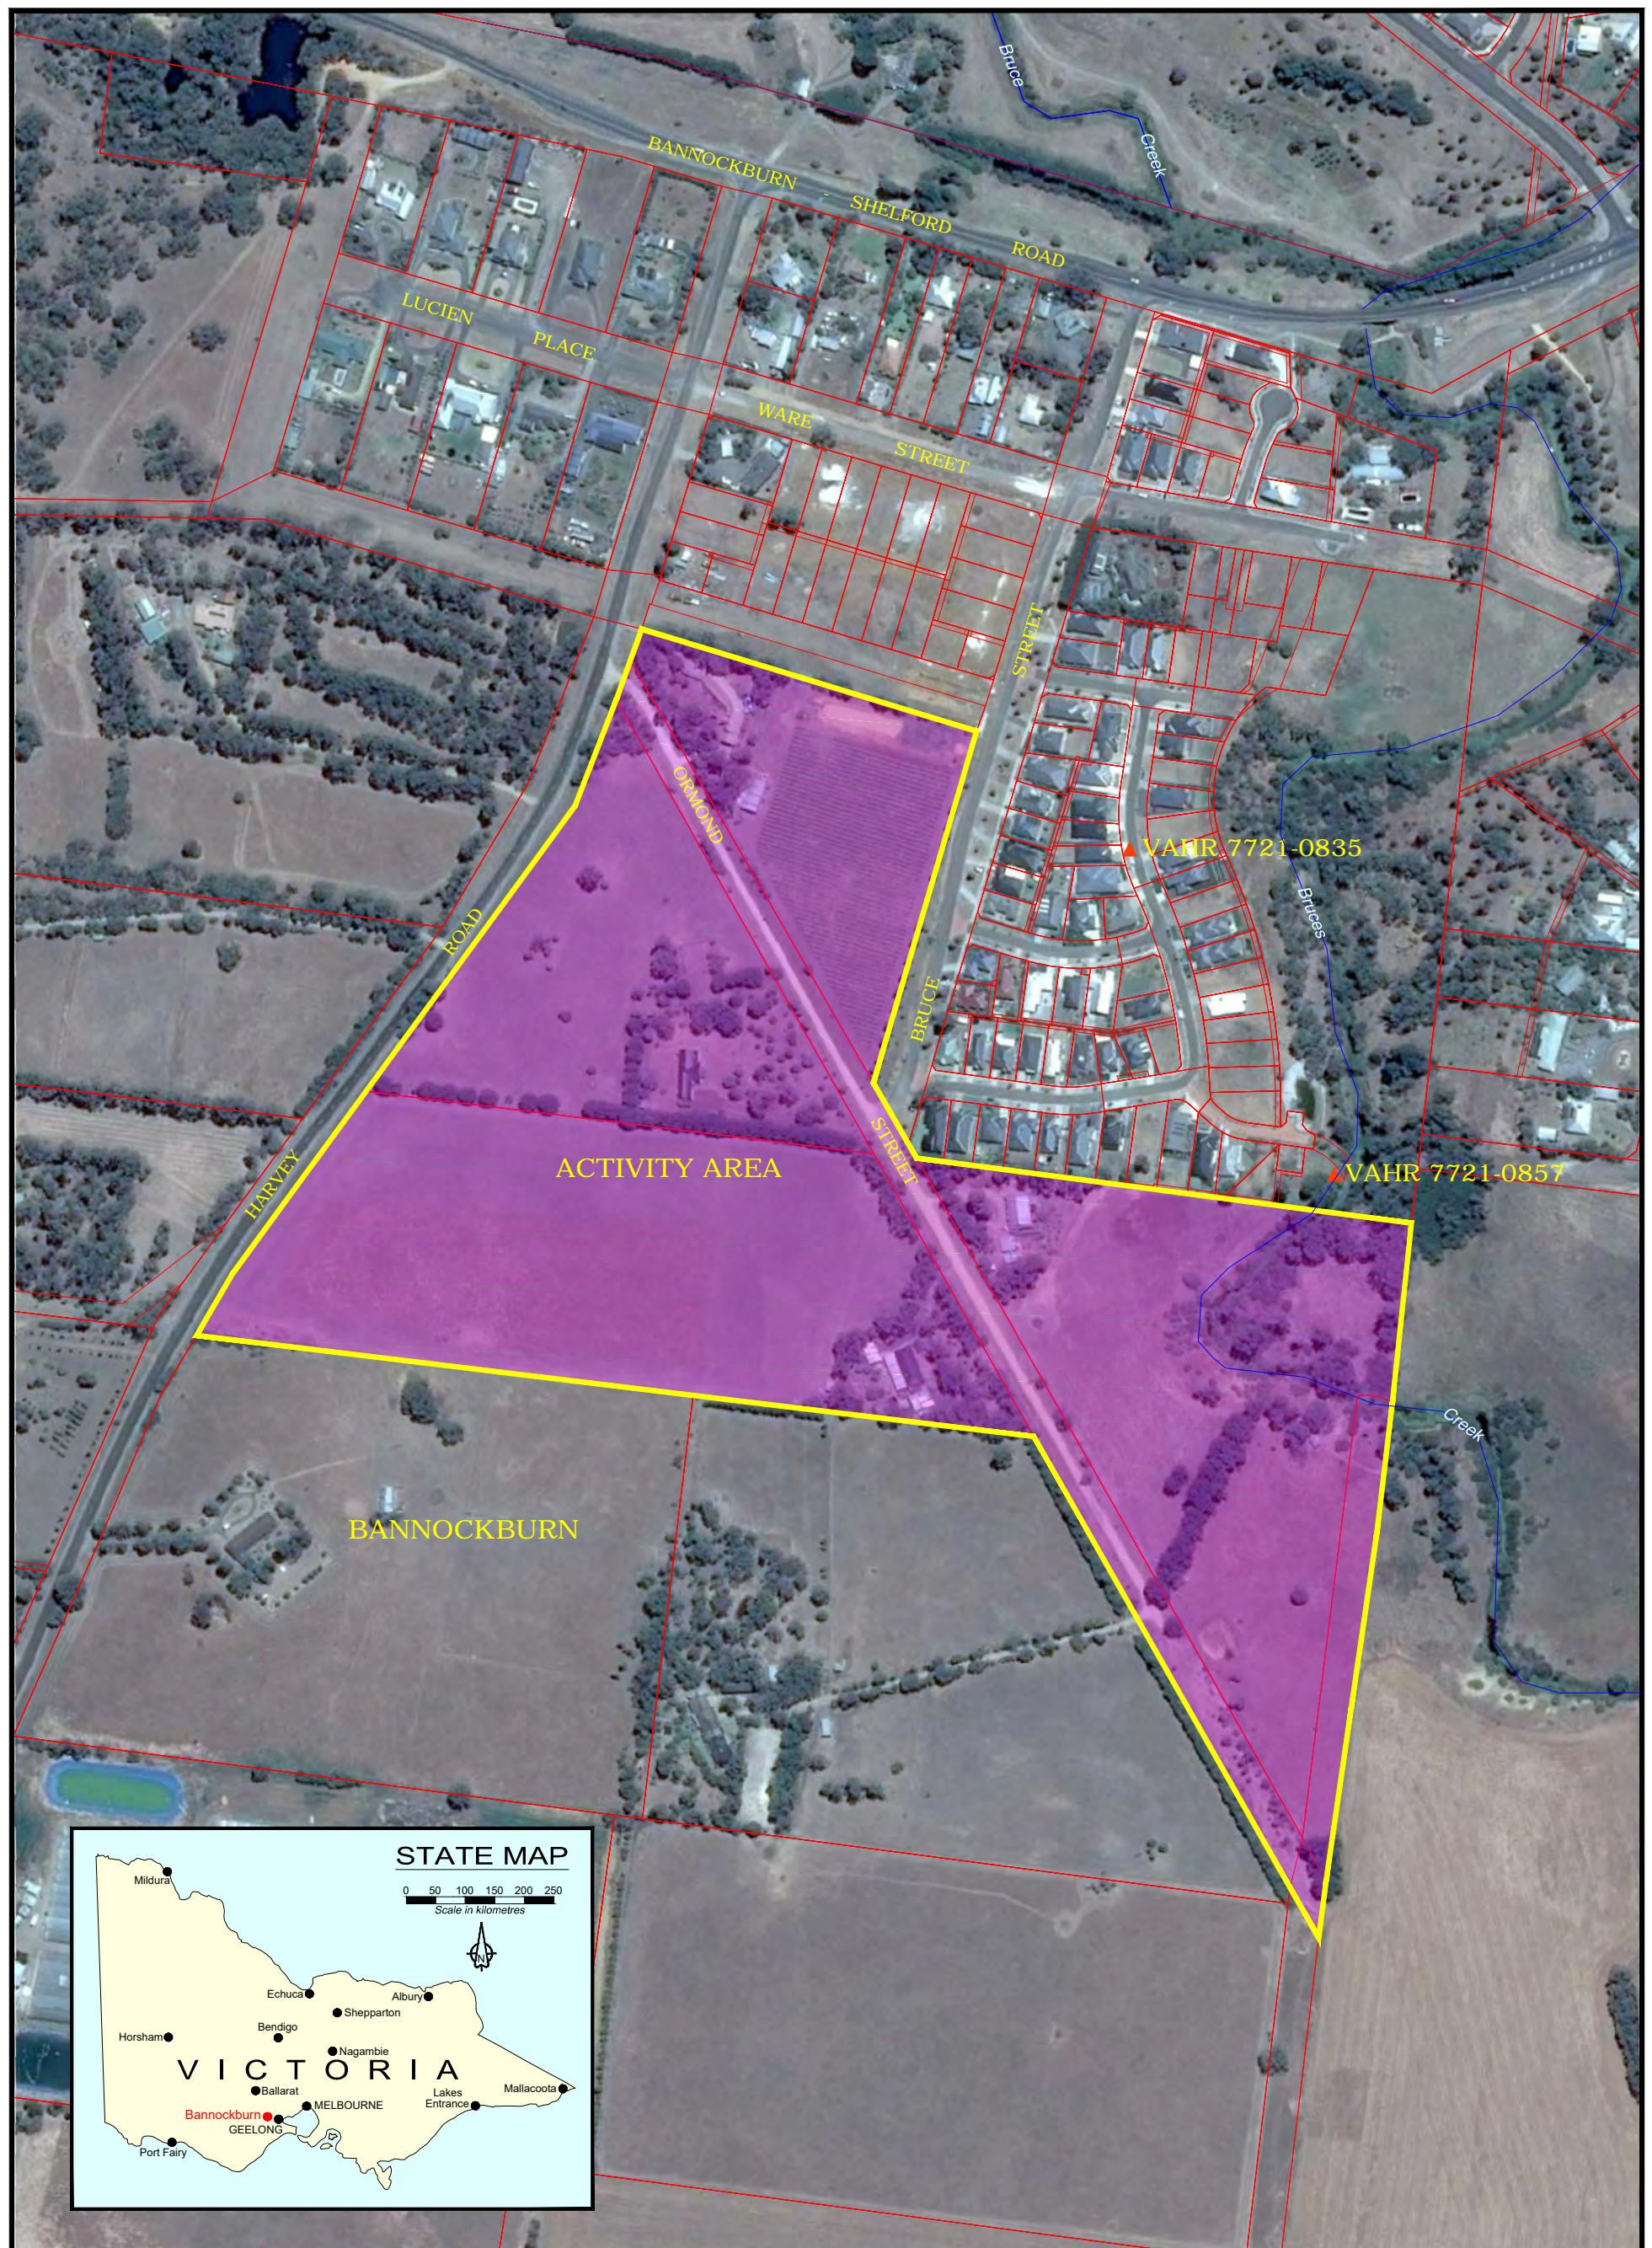

Once all three are received the 30-day evaluation period will begin.

For further information regarding this advice, please contact

Paul Davis on:  
03 43080420  
[paul@wathcorp.com.au](mailto:paul@wathcorp.com.au)  
Yours sincerely,

**Paul Davis**  
**General Manager**

## Appendix B: Compliance Review Checklist

Task	Section within	Yes/No
	CHMP	
Is a hard copy of approved CHMP 15813 containing this checklist kept onsite and referred to when necessary?	1.1.1	
Has an induction by the RAP been carried out prior to the commencement of the activity?	1.1.2	
Have compliance checks by the RAP been carried out before, during and after the activity, subject to OH&S requirements?	1.1.3	
Have the salvage excavations taken place following the pre-salvage meeting to develop the methodology?	1.3.1	
Has arrangement been made in consultation with the RAP for the repatriation of Aboriginal Cultural Heritage found during the CHMP and subsequent salvage?	1.2.1, 1.3.2, 1.4.1	
<b>Has all soil excavated during the conduct of the activity been retained within the Activity Area?</b>	1.1.5	
If unexpected Aboriginal cultural heritage or that changes the previously understood nature and extent of the registered place was identified during the activity, was the following undertaken:		
<ul style="list-style-type: none"> <li>▪ Have works in the immediate location of the Aboriginal cultural heritage or suspected Aboriginal cultural heritage been suspended and has a 10m exclusion zone been set up with an appropriate barrier and signage?</li> </ul>	2.4.1	
<ul style="list-style-type: none"> <li>▪ Has a Heritage Advisor been notified, and made an assessment within 48 hours of the discovery?</li> </ul>	2.4.2	
<ul style="list-style-type: none"> <li>▪ Has the Heritage Advisor taken all necessary steps to evaluate the nature and extent of the discovery and submitted all appropriate documentation with the VAHR within 2 weeks?</li> </ul>	2.4.3	
<ul style="list-style-type: none"> <li>▪ Has the appropriate course of action been determined and enacted according to the results of the evaluation of the discovery?</li> </ul>	2.4.4	

Task	Section within CHMP	Yes/No
▪ Have all conditions been met before recommencing activity?	2.4.5	
▪ Have the custody and management arrangements determined in consultation with the RAP been completed?	2.4.6	
If suspected human remains were discovered, was the following undertaken:		
▪ Were the RAP, Victoria Police and State Coroner's Office immediately notified? If the remains are reasonable suspected to be Aboriginal, has the Coronial Admissions and Enquiries hotline been immediately contacted on 1300 888 544?	2.3	
▪ Has all activity in the vicinity stopped and the remains left in place?	2.3.1	
▪ Have all relevant parties been notified of the discovery?	2.3.2	
▪ Has an appropriate mitigation or salvage strategy as determined by the Victorian Aboriginal Heritage Council been implemented?	2.3.3	
▪ Has the treatment of salvaged Aboriginal Ancestral remains been in accordance with the direction of the Victorian Aboriginal Heritage Council?	2.3.4	
▪ Has the reburial site(s) been fully documented by an experienced and qualified archaeologist, clearly marked and all details provided to Aboriginal Victoria and appropriate management measures been implemented to ensure the remains are not disturbed in the future?	2.3.5	

## Appendix C: Glossary of Terms

**Aboriginal Archaeological Place:** A site, place or area of land or of water that is of Cultural Heritage Significance to the Aboriginal people of Victoria.

**Aboriginal Archaeological Place Types:** Aboriginal archaeological Places can be classified into generic types according to their context, fabric and probable function. Aboriginal Victoria currently recognises some 10 site types including stone artefact scatters, shell middens and scarred trees.

**Aboriginal Artefact Scatter:** A collection of Aboriginal artefacts usually distributed across the surface of the ground. Stone artefacts are a common component and can be found in association with organic remains, shell, ochre and charcoal. Artefact scatters are the material remains of past Aboriginal use of a location and are generally referable to technological and economic behaviour. They are also called surface scatters.

**Aboriginal Burial:** Aboriginal interment consisting of human skeletal remains. Aboriginal burials occur in a wide range of forms and physical contexts and may be found with grave goods.

**Aboriginal Historic Place:** Aboriginal historic places are the locations of events, places or place names that were recorded in historical documents or in oral tradition during the *post contact period*. Unlike Aboriginal archaeological sites, Aboriginal historic places do not necessarily retain any physical evidence of any former structures, activities or specific events.

**Activity Area:** The area that is under investigation, also referred to as a study area.

**Angular Fragment:** Shatter or blocky pieces of stone produced during flaking processes.

**Archaeology:** Conventionally, the scientific study of the material remains of past human activity.

**Artefact:** Any object created or modified by humans.

**Assemblage:** Archaeological term used to describe a collection of artefacts associated by a particular place or time and assumed to have been generated by a single group of people. An assemblage can be made from different *artefact* types.

**AV:** Aboriginal Victoria, Department of Premier and Cabinet (Victoria).

**Blade:** A *flake* that is at least twice as long as it is wide.

**CHMP:** Cultural Heritage Management Plan

**Complex Assessment:** The subsurface excavation component of the Cultural Heritage Management Plan.

**Context:** Refers to the place of artefacts or archaeological features with regards to time and space.

**Core:** A piece of stone from which other stone artefacts are made. In *freehand flaking* the *core* would be struck with a *hammerstone* removing *flakes* and other fragments of stone often referred to as *debitage*.

**Core Tool:** A *core* displaying signs of use.

**Cortex:** The weathered external surface of a stone. Cortex often identifies the origins and original form of flaked stone, e.g. river pebbles.

**Debitage:** By-products produced during the flaking process.

**Desktop Assessment:** The background research component of a Cultural Heritage Management Plan.

**Excavation:** The systematic removal of archaeological deposits using archaeological techniques.

**Flake:** A piece of stone detached by percussion or pressure from a *core*. The flake will usually display characteristic features such as a *platform* and *bulb of percussion*. The *core* will display a negative flake scar. These features assist in distinguishing between stone that has been altered through human agency and that which has been naturally shaped.

**Ground Visibility:** A term used to describe the area of the ground's surface that is visible during archaeological field surveys. Effective ground visibility refers to the actual area of ground visible during a field survey calculated as the area of ground inspected multiplied by the percentage of ground visibility.

**HA:** Heritage Advisor.

**Hornfels:** Fine grained metamorphic stone, created by contact between sedimentary stones and intrusive igneous masses to produce a stone which is quite hard and durable.

**Industry:** A single class of artefacts that are consistent in their form and that can be credited to a single group of people.

**In situ:** In its original place.

**Layer:** A recognisable band of material of varying thickness, also known as a *stratum*.

**LDAD:** Low Density Artefact Distribution.

**Platform:** Face of core that is struck by a *hammerstone*, leaving remnants on both the *core* and the resultant *flake*.

**Pleistocene:** The geological period equivalent to the last ice age and preceding the *Holocene* from ca 2 million to 10,000 years ago. The late Pleistocene commonly refers to the last 40,000 years *BP*.

**RAP:** Registered Aboriginal Party

**Quartz:** A hard mineral that varies from white to blue in colour and in transparency from opaque to clear.

**Quartzite:** A metamorphic rock formed through the ‘re-crystallisation of quartz rich sandstone’.

**Retouch:** Secondary modifications to stone artefacts such as trimming or resharpening. Retouch often indicates use of a stone *flake* and therefore its identification as a stone tool.

**Salvage Excavation:** The systematic documentation and recovery of an archaeological site prior to its destruction, also known as rescue archaeology.

**Scarred Trees, Aboriginal:** Trees that were used as a source of bark to make canoes and other items. Bark was cut using a stone axe and then levered from the sapwood leaving a scar. The bark around the edge of this scar is called regrowth. Natural scarring is common on some trees and is often difficult to distinguish from scars made by Aborigines during the *pre-contact period*.

**Scraper:** A stone tool made on a *flake* or *core* with *retouch* along one or more edges.

**Silcrete:** A highly siliceous rock formed by the replacement of a parent rock (commonly sandstone) by silica in solution.

**Spit:** Arbitrary quantity of excavated ground.

**Standard Assessment:** The survey component of the Cultural Heritage Management Plan.

**Stratigraphy:** A geological term used to describe the sequence of vertical *layers* and *deposits* that comprise an archaeological site.

**Strata:** The distinct layers of earth in an archaeological site.

**Subsurface Testing:** The testing for buried archaeological material through manual or mechanical excavation.

**Survey, Pedestrian:** The systematic examination of the ground surface for archaeological material, also known as a foot survey.

**Test Pit:** A small excavation unit dug to investigate the depth of stratum and the presence or absence of archaeological material.

**VAHR:** Victorian Aboriginal Heritage Register.

**WTOAC:** Wadawurrung Traditional Owners Aboriginal Corporation.

# **1 INTRODUCTION**

## ***1.1 Project Background***

Land at Bruce Street, Harvey Road and Ormond Road Bannockburn, is proposed to be rezoned for high-density residential sub-division. This report was commissioned by TGM Group P/L to assess the quantity and significance of any indigenous flora and fauna habitat that might be present in the subject site.

Under Clause 52.17 of the Victorian Planning Scheme, the State has gazetted the Native Vegetation Removal Regulations (revised in December 2017). The reforms ‘introduce a risk based approach to assessing applications to remove native vegetation’ (DELWP Website i) Refer to Section 4.2 for further discussion.

## ***1.2 Objectives***

The objectives of this investigation are to:

- Describe the flora and fauna habitat values of the study area.
- Evaluate the conservation significance of the study area.
- Assess any potential impacts of the proposed development.
- Determine the implications of any native vegetation removal for the relevant government policy and legislation.
- Determine any vegetation offset implications.

## ***1.3 Study Area***

The study area is comprised of approximately 19 ha of land at Bruce Street, Harvey Road and Ormond Road Bannockburn, located within the Golden Plains Shire. The site is within the Victorian Volcanic Plains bioregion and is located within the Corangamite Catchment Management Authority region (DELWP website ii). The study area is currently zoned Farm Zone (FZ) and is in part (i.e. the Bruces Creek corridor) subject to Environment Significance Overlay 2 under the Golden Plains Shire Planning Scheme (DPCD website i).

The site appears to have a history of disturbance. Small areas of degraded indigenous vegetation, including areas of partially intact native vegetation within the Bruces Creek corridor, occur.

The adjacent areas of the Bruce Street, Harvey Road and Ormond Road roadside reserves were inspected and were found to be comprised, in part, of native vegetation.

The location of the study area is shown on Figure 1.

## **1.4 Proposed Development**

The proposed use is to rezone the land for medium-density residential use. It is anticipated that the proposed use will impact upon the majority of the study area. The area of Bruces Creek corridor is proposed to be retained and designated as a reserve.

**Figure 1 Study area location**

**Figure 1.** Study area location and proposed sub-division layout.

## **2 METHODS**

### **2.1 Taxonomy**

Scientific names for plants follow the Flora of Victoria (RBG Website i). Common names for plants follow the Flora of Victoria Vols 2-4 (Walsh and Entwistle 1994-1999).

### **2.2 Literature and Database Review**

Relevant literature, online resources and databases were reviewed to provide an up to date assessment of ecological values associated with the study area and surrounds, including:

- The Victorian Department of Environment, Land, Water and Planning (DELWP) Naturekit Interactive Map (DELWP website ii) for:
  - Modelled data for remnant vegetation patches and habitat for rare or threatened species and
  - the extent of historic and current Ecological Vegetation Classes (EVC)s.
- The Victorian Biodiversity Atlas (VBA) (DELWP website iii) for previously documented flora and fauna records within the project locality (to approximately 10 kilometres of the study area)
- Aerial photography of the study area (Google maps).

### **2.3 Field Survey**

The site was inspected on foot on the 3rd of July 2018. The entire site was traversed. Records were made of all indigenous vascular plant species. Records were made of the existing faunal habitat values and dominant exotic vascular plant species.

### **2.4 Limitations**

The assessment was conducted winter, a time of year that is suitable for the detection of most, but not all, flora species likely to occur on site. Due to the relatively degraded nature of the understorey vegetation of the majority of the study area, the site inspection (with the exception of the roadside reserves) is considered to be sufficient to assess the ecological values of the site. As a result, there are not considered to be any significant limitations to the study.

The survey includes only vascular flora. Habitat Hectare assessments were not undertaken. Consequently, non-vascular flora (mosses, lichens, fungi, etc.) were not recorded. Fauna was not surveyed.

### **2.5 Defining Significance**

A number of criteria are applied in order to assess the significance of flora species and vegetation communities. The definition of the criteria is detailed in Appendix 1.

## **2.6 Defining and Assessing Vegetation**

Native vegetation in Victoria has been defined by DELWP as belonging to two categories. These are:

### **Patch native vegetation**

Patch native vegetation is either:

- any area of vegetation where at least 25 per cent of the total perennial understorey plant cover is native
- any area with three or more native canopy trees where the canopy foliage cover is continuous.

### **Scattered Tree native vegetation**

Scattered tree native vegetation is:

- a native canopy tree that does not form part of a patch.

(DELWP website ii).

### **Habitat Hectares**

Habitat hectares (Vegetation Quality Assessment) is a site-based measure that combines extent and condition of native vegetation. The current condition of native vegetation is assessed against a benchmark for its Ecological Vegetation Class (EVC). EVCs are classifications of native vegetation types. The benchmark for an EVC describes the attributes of the vegetation type in its mature natural state, which reflects the pre-settlement circumstances. The condition score of native vegetation at a site can be determined through undertaking a habitat hectare assessment. The habitat hectares of native vegetation is calculated by multiplying the current condition of the vegetation (condition score) by the extent of native vegetation.

(DELWP website ii).

## **3 RESULTS**

### ***3.1 Vegetation Condition***

The study area carries predominately exotic vegetation. Small areas of native vegetation consisting of isolated River Red Gum (*Eucalyptus camaldulensis*) and Manna Gum (*Eucalyptus viminalis*) mature trees occur. The majority of the study area appears to have been subject to intensive agriculture (improved pasture, intensive grazing, vineyards, etc.) and rural residential use.

With the exception of the areas of mature Eucalypts and associated understorey vegetation, the vegetation of the study area is assessed to be substantially modified as a result of disturbance and is assessed to be of negligible ecological value.

Areas of native vegetation were recorded on Ormond Street.

Areas of non-indigenous native trees and exotic Cypress and Pine trees have been planted, mostly as shelter belts and in association with the existing residences.

Refer to Figure 4 for the location of the native vegetation. Refer to Plates 1-7 for photographs of the vegetation existing conditions.

### ***3.2 Faunal Habitat Values***

No fauna assessment was undertaken. Given the degraded nature of the surrounding area and the substantially modified understorey, the River Red Gum, Manna Gum and the planted specimens of non-indigenous native trees are assessed as being likely to provide habitat and a food source for locally significant faunal species.

The majority of the study area, being exotic pasture, is unlikely to provide more than negligible faunal habitat value.

### **3.3 Ecological Vegetation Class**

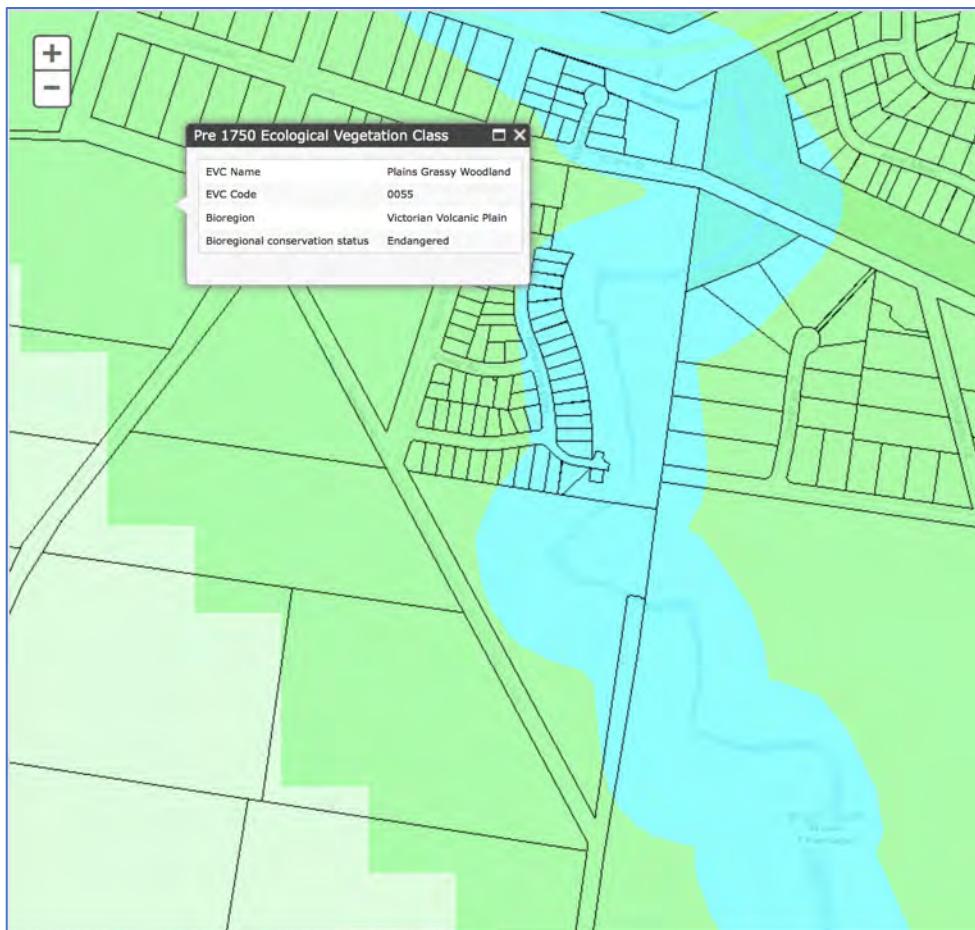

Ecological Vegetation Classes (EVCs) are the primary level of classification of vegetation communities within Victoria. An EVC contains one or more plant (floristic) community, and represents a grouping of vegetation communities with broadly similar ecological attributes. Classification of EVCs in this report follows Oates and Taranto (2002).

The pre-1750 EVC mapping of the study area undertaken by DELWP (DELWP website i) indicates that the study area was comprised of EVC 55 Plains Grassy Woodland (the majority of the study area), EVC 68 Creekline Grassy Woodland (Bruces Creek riparian zone) and EVC 132 Plains Grassland.

The current study records vegetation that accords with EVC 55 Plains Grassy Woodland and EVC 68 Creekline Grassy Woodland.

EVC 55 Plains Grassy Woodland and EVC 68 Creekline Grassy Woodland are both listed as ‘Endangered’ in the Victorian Volcanic Plain bioregion (DELWP website ii). Endangered refers to an EVC that has less than 10% of its pre-european distribution remaining within the bioregion. Refer to Figure 2 for DELWP EVC mapping.

**Figure 2 EVC Distribution**

**Figure 2.** Distribution of EVCs pre-1750. Data by DELWP (DELWP website ii).

### 3.4 Flora

A total of 12 indigenous vascular plant species was recorded from the study area.

Refer to Table 1 for a list of indigenous vascular plant species, location and conservation significance recorded during this survey. Refer to Table 2 for a list of dominant exotic vascular plant species recorded during this survey.

Refer to Figure 4 for the location of vegetation. Refer to Plates 1-7 for photographs of vegetation existing conditions.

**Table 1 Indigenous Vascular Plant Species, Location and Conservation Significance**

Botanical Name	Common Name	Private Property	Roadside Reserve	Creek Reserve	Significance
<i>Acacia mearnsii</i>	Late Black Wattle	✓	✓		Local
<i>Acacia paradoxa</i>	Hedge Wattle	✓		✓	Local
<i>Acacia pycnantha</i>	Golden Wattle		✓		Local
<i>Austrostipa mollis</i>	Spear-grass	✓	✓		Local
<i>Dianella revoluta</i>	Black-anther Flax-lily		✓		Local
<i>Eucalyptus camaldulensis</i>	River Red Gum	✓		✓	Local
<i>Eucalyptus viminalis</i>	Manna Gum	✓	✓		Local
<i>Lomandra filiformis</i>	Wattle mat-rush		✓		Local
<i>Microleana stipoides</i>	Weeping Grass	✓	✓		Local
<i>Phragmites australis</i>	Common Reed			✓	Local
<i>Rytidosperma caespitosum</i>	Common Wallaby-grass	✓	✓		Local
<i>Themeda triandra</i>	Kangaroo Grass		✓		Local

**Table 2 Dominant Exotic Vascular Plant Species**

Botanical Name	Common Name
<i>Acetosella vulgaris</i>	Sheep Sorrel
<i>Arctotheca calendula</i>	Capeweed
<i>Agrostis stolonifera</i>	Creeping Bent-grass
<i>Cirsium vulgare</i>	Spear-thistle
<i>Cynodon dactylon</i>	Couch Grass
<i>Dactylis glomerata</i>	Cock's-foot Grass
<i>Ehrhartia calycina</i>	Veldt-grass
<i>Galenia pubescens</i>	Blanket Weed
<i>Juncus acuta</i>	Spiny-rush
<i>Lolium sp</i>	Rye-grass
<i>Lycium ferocissimum</i>	Boxthorn
<i>Marubium vulgare</i>	Horehound
<i>Nassella neesiana</i>	Chilean Needle-grass
<i>Nassella trichotoma</i>	Serrated Tussock

<i>Oxalis pes-caprae</i>	Soursob
<i>Phalaris aquatica</i>	Canary-grass
<i>Pinus radiata</i>	Monterey Pine
<i>Plantago lanceolata</i>	Ribwort
<i>Romulea</i> sp	Onion-grass
<i>Schinus molle</i>	Pepper Tree

### **3.5 Flora Significance**

The 12 recorded indigenous vascular plant species are all assessed to be of local conservation significance. Refer to Table 1 for significance. Refer to Appendix 1 for the rational for assessing conservation significance.

## **4 LEGISLATION AND GOVERNMENT POLICY**

### **4.1 Commonwealth**

#### **4.1.1 Environment Protection and Biodiversity Conservation Act (1999)**

The Environment Protection and Biodiversity Conservation (EPBC) Act (1999) was established to ‘promote the conservation of biodiversity by providing strong protection for listed species and communities in the Commonwealth and for protected areas, Ramsar sites, Commonwealth Reserves, conservation zones and World Heritage sites, etc’.

The EPBC Act applies to developments and associated activities that have the potential to significantly impact on matters protected under the Act. Under the Act, unless exempt, actions require approval from the Australian Government Minister for Environment and Heritage if they are likely to significantly impact on a ‘matter of national environmental significance’. There are currently seven matters of national environmental significance (NES):

- World Heritage properties;
- National Heritage properties;
- nationally listed threatened species and ecological communities;
- listed migratory species;
- Ramsar wetlands of international significance;
- Commonwealth marine areas; and
- nuclear actions (including uranium mining).

Any person proposing to take an action that may, or will, have a significant impact on a matter of national environmental significance must refer the action to the Australian Government Minister for Environment and Water Resources for determination as to whether the action is a ‘controlled action’ or is not approved.

Grassy Eucalypt Woodland of the Victorian Volcanic Plain is an ecological community that is listed as ‘Critically Endangered’ under the EPBC Act (EPBC Website i). The study area once carried vegetation that may have been considered part of this community.

#### **4.1.2 Implications**

Due to the relatively small and degraded nature of the native vegetation of the study area there are not likely to be any implications for the Grassy Eucalypt Woodland of the Victorian Volcanic Plain community for the current proposal under the EPBC Act.

## **4.2 State Native Vegetation Permitted Clearing Regulations**

Under Particular Provision (Native Vegetation Clause 52.17) the State has gazetted the Native Vegetation Permitted Clearing Regulations (the ‘Guidelines’), revised in December 2017. The reforms introduce a risk-based approach to assessing applications to remove native vegetation.

The purpose of Clause 52.17 is to ensure that there is no net loss to biodiversity as a result of the removal, destruction or lopping of native vegetation. This means permitted clearing has a neutral impact on Victoria’s biodiversity. This is achieved by applying the following three step approach in accordance with the *Guidelines for the removal, destruction or lopping of native vegetation* (Department of Environment, Land, Water and Planning, 2017):

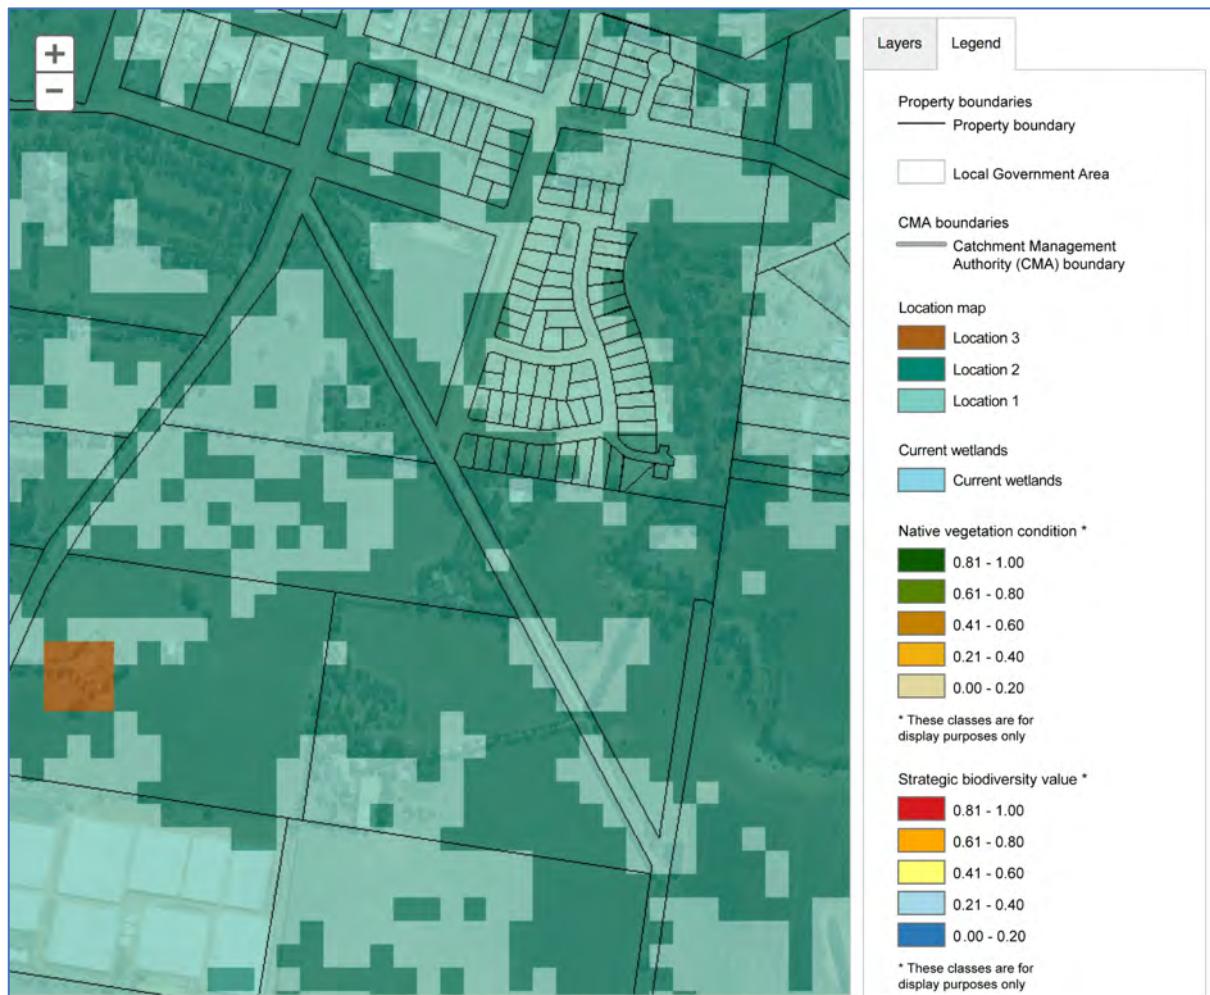

1. Avoid the removal, destruction or lopping of native vegetation.
2. Minimise impacts from the removal, destruction or lopping of native vegetation that cannot be avoided.
3. Provide an offset to compensate for the biodiversity impact if a permit is granted to remove, destroy or lop native vegetation.

To manage the removal, destruction or lopping of native vegetation to minimise land and water degradation. (DELWP Website i).

When native vegetation removal is permitted, an offset must be secured which achieves a no net loss outcome for biodiversity. To achieve this the offset makes a contribution to Victoria’s biodiversity that is equivalent to the contribution made by the native vegetation that was removed. The type and amount of offset required depends on the native vegetation being removed and the contribution it makes to Victoria’s biodiversity.

Implications for the current proposal are discussed as follows. Refer to Figure 3 for Location mapping (DELWP data).

**Figure 3 Vegetation Location**

**Figure 3.** Distribution of vegetation according to 'Location'. Light green equates to 'Location 1' (i.e. least risk). Dark green equates to 'Location 2' (i.e. medium risk) (DELWP Website i). The study area is sited within areas of both Location 1 and 2.

#### 4.2.1 Patch native vegetation

Under the Regulations, any areas of remnant patch native vegetation that are proposed to be removed are subject to protection/and or recruitment offsets, depending upon the characteristics of the site.

Two areas of patch native vegetation were recorded for the study area. These are:

- The Brunes Creek linear riparian zone dominated by River Red Gum. This vegetation is proposed to be retained and incorporated into the creek corridor reserve system.
- One area of Manna Gum dominated vegetation, comprised of 9 small trees and Wallaby-grass.

Note that patch native vegetation also occurs on Ormond Street roadside reserve.

## **4.2.2 Scattered Tree native vegetation**

Under the Regulations, any scattered native canopy trees that are proposed to be removed are subject to protection/and or recruitment offsets, depending upon the characteristics of the site.

Within the VVP bioregion, EVC 55 and ECV 68 have *Eucalyptus* spp as ‘canopy trees’.

For practicality, standard extent amounts has been developed for scattered trees, based tree size and the habitat hectare assessment method.

A total of 1 scattered tree was recorded for the study area.

Table 3 gives the following data for the recorded trees, tree number, species name, diameter at breast height and Tree Protection Zone. Figure 4 shows the location of the scattered trees.

**Table 3 Scattered trees recorded for the study area**

Tree #	Botanical Name	DBH (cm)	TPZ (m)
1	<i>Eucalyptus camaldulensis</i>	42	5

Tree protection zones are calculated in accordance with Australian Standard AS4970-2009 *Protection of trees on development sites*. Refer to Appendix 3.

## **4.2.3 Implications**

The results show that the current native vegetation condition is confined to one scattered tree and two patches of native vegetation. Of that vegetation one scattered tree and one patch of vegetation is proposed to be removed. The larger patch of native vegetation, the Brunes Creek riparian corridor is proposed to be retained.

The total extent of native vegetation proposed to be removed is 0.092 ha (one patch and one small scattered tree).

An application to remove one scattered tree and one patch of native vegetation is proposed. The remaining areas of native vegetation on private land are intended to be retained and given appropriate protection measures. An application to remove this one scattered tree and one patch of native vegetation would be classified a intermediate risk-based application.

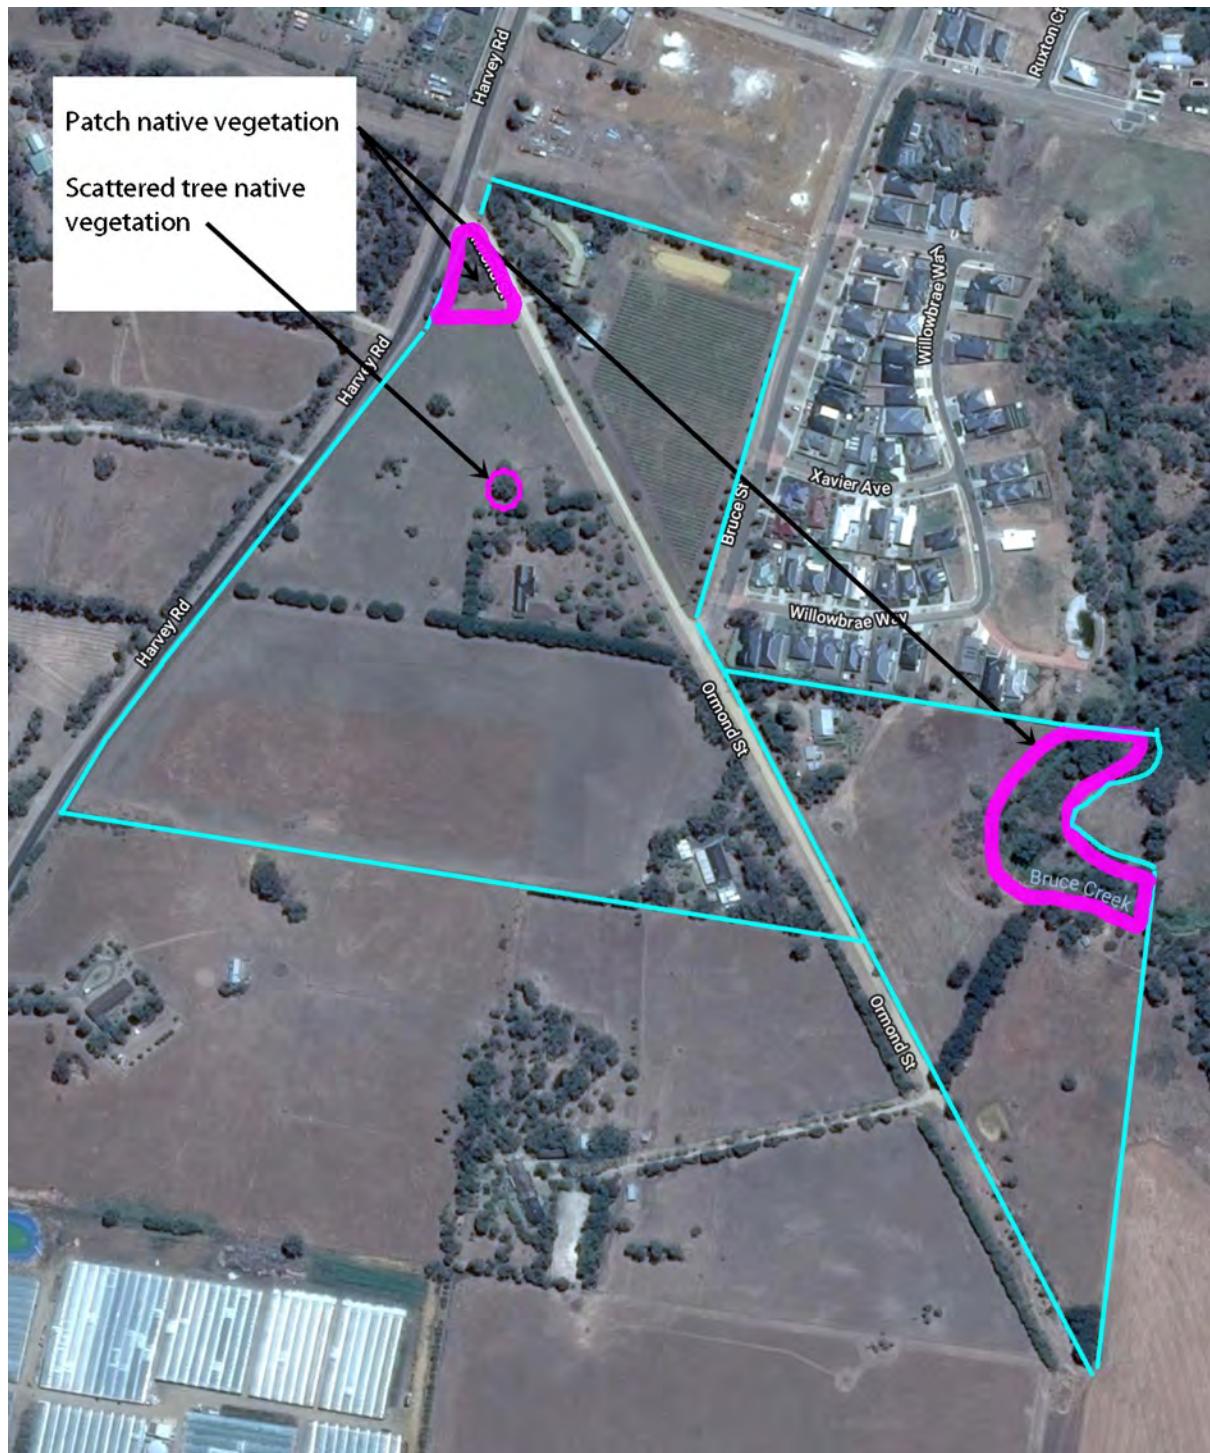

Should a permit to remove this native vegetation be granted the vegetation offset requirements would be to generate:

- 0.068 general biodiversity equivalence units
- to be achieved within the Corangamite CMA area
- with a minimum strategic biodiversity score of 0.464.

Refer to Appendix 2 for the Native vegetation removal report.

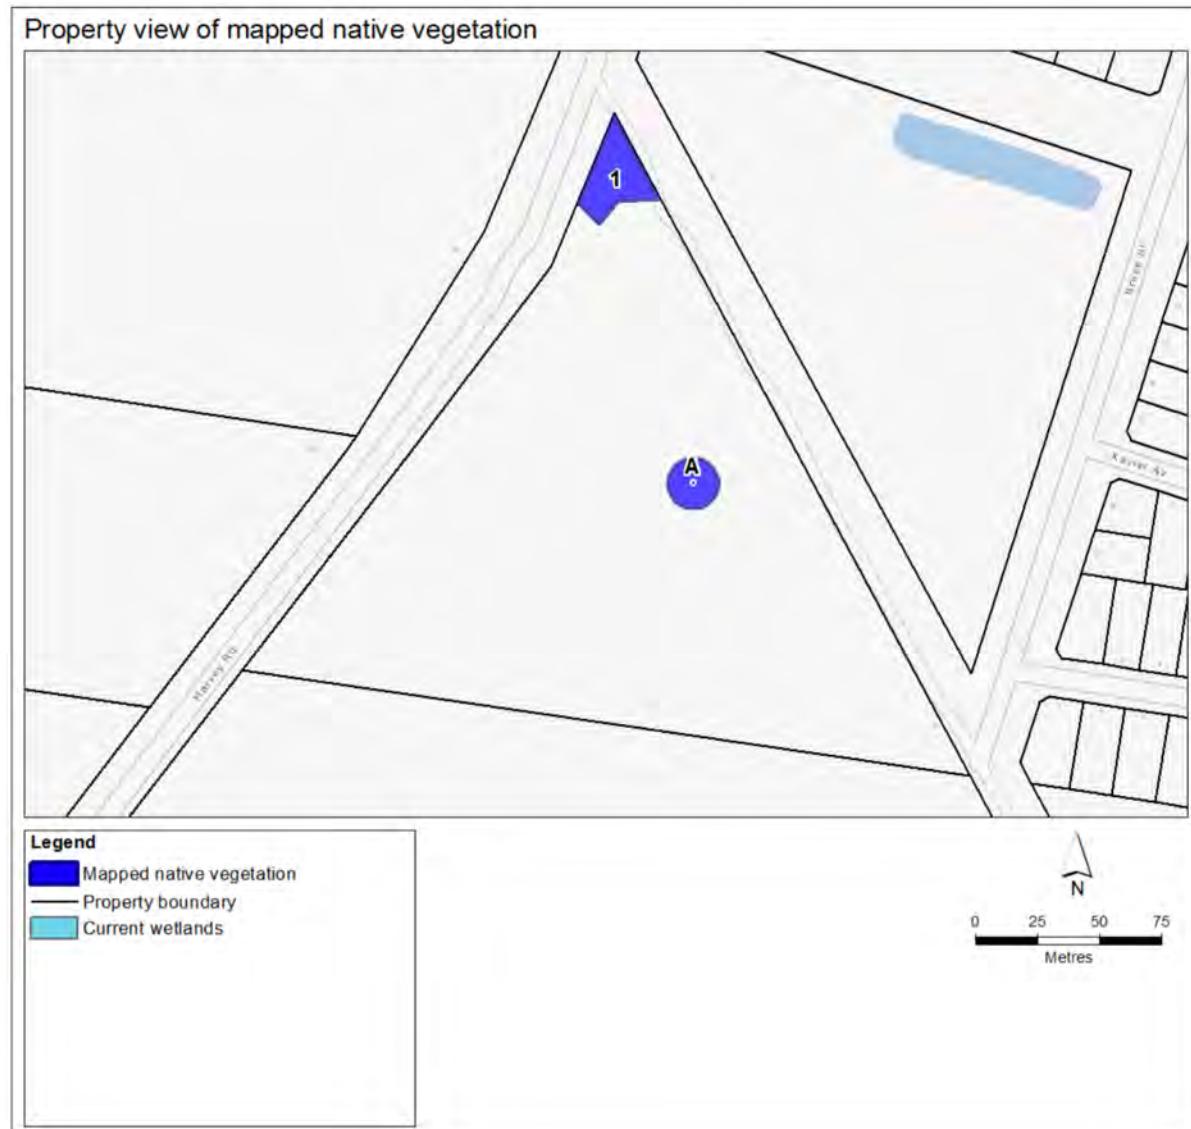

Refer to Figure 4 for the location of native vegetation. Refer to Figure 5 for the location of native vegetation proposed to be removed. Refer to Plates 1-7 for photographs of vegetation existing conditions.

**Figure 4 Location of native vegetation**

**Figure 4.** Location of recorded patch and scattered tree native vegetation.

**Figure 5 Location of native vegetation proposed to be removed**

**Figure 5.** Location of the patch and scattered tree native vegetation proposed to be removed.

## **5 CONCLUSIONS**

### **Description**

The privately owned land of approximately 19 ha of land at Bruce Street, Harvey Road and Ormond Road Bannockburn, that is the subject of this report, is proposed to be rezoned for residential sub-division. It is anticipated that the majority of the site will be impacted upon.

### **Results**

The majority of the site carries exotic vegetation.

Small areas of native vegetation were recorded. The native vegetation is assessed as follows:

- Partially intact riparian patch vegetation, dominated by River Red Gum located along Brucies Creek corridor, proposed to be retained.
- One scattered River Red Gum tree, proposed to be removed.
- One patch dominated by Manna Gum, proposed to be removed.

A total of 12 indigenous locally significant vascular plant species was recorded from the study area.

The current study records native vegetation that accords with EVC 55 Plains Grassy Woodland and EVC 68 Creekline Grassy Woodland. EVC 55 Plains Grassy Woodland and EVC 68 Creekline Grassy Woodland are both listed as ‘Endangered’ in the Victorian Volcanic Plain bioregion.

Faunal habitat values are of local significance.

Due to the relatively small and degraded nature of the native vegetation of the study area there are not likely to be any implications for the Grassy Eucalypt Woodland of the Victorian Volcanic Plain community for the current proposal under the EPBC Act.

If, under Clause 52.17, a permit was sought to remove the single scattered tree and patch native vegetation as described, the application would be assessed as a intermediate assessment pathway application.

Should a permit to remove a single dead scattered tree be granted the vegetation offset requirements would be to generate 0.068 general biodiversity equivalence units, to be achieved within the Corangamite CMA area, with a minimum strategic biodiversity score of 0.464.

### **Limitations**

There are not considered to be any significant limitations to this study.

## **Appendix 1 - ASSESSING CONSERVATION SIGNIFICANCE**

Conservation significance is assessed at a range of scales, including global, international, national, state, regional and local. Criteria used for determining the conservation significance of flora at national to local scales are presented below for botanical conservation significance.

### ***Botanical Significance***

**National** botanical significance applies to an area when it supports one or more of the following attributes:

a population of at least one nationally threatened plant species listed by Briggs and Leigh (1996) or plant species listed on the schedules to the Commonwealth *Environment Protection and Biodiversity Conservation Act 1999*.

A nationally threatened ecological community listed on the schedules of the *Environment Protection and Biodiversity Conservation Act 1999*.

**State** botanical significance applies to an area when it supports one or more of the following attributes:

A population of at least one plant species threatened in Victoria, as listed by Gullan et al. (1990), NRE (2000a) or more recently in the unpublished records of the Flora Information System (NRE), or on the schedules to the Victorian *Flora and Fauna Guarantee Act 1988*.

An ecological community considered threatened in Victoria through its listing on the schedules of the *Flora and Fauna Guarantee Act 1988*.

**Regional** botanical significance applies to an area that supports one or more of the following attributes:

Supports a population of one or more regionally depleted species defined in a valid regional assessment of biodiversity (eg. Regional Native Vegetation Plan, Environment Conservation Council Report or Comprehensive Regional Assessment documents).

An ecological vegetation class that is considered endangered or vulnerable in a particular bioregion (based on Conn 1993 and the Regional Native Vegetation Plan), in which case the area is of **High Regional** significance.

An ecological vegetation class that is considered depleted in a particular bioregion (based on Conn 1993 and the Regional Native Vegetation Plan), in which case it is of **Regional** significance.

**Local** botanical significance applies to all remnant native vegetation that does not meet the above criteria. In much of Victoria native vegetation has been so depleted by past clearing and disturbance that all remaining vegetation must be considered to be of at least local conservation significance.

## Appendix 2 Native Vegetation Removal Report

### Native vegetation removal report

A report to support an application to remove, destroy or lop native vegetation in the **Intermediate Assessment Pathway** using the modelled condition score

This report provides information to support an application to remove native vegetation in accordance with the *Guidelines for the removal, destruction or lopping of native vegetation*. The report is not an assessment by DELWP or local council of the proposed native vegetation removal. Biodiversity information and offset requirements have been calculated using modelled condition scores contained in the *Native vegetation condition map*.

Date and time: 17 July 2018 14:21 PM

Lat./Long.: -38.0545190178997,144.1579249582

Native vegetation report ID:

Address: 20 ORMOND STREET BANNOCKBURN  
3331

324-20180717-016

### Assessment pathway

#### The assessment pathway and reason for the assessment pathway

Assessment pathway	Intermediate Assessment Pathway
Extent of past plus proposed native vegetation removal	0.092 hectares
No. large trees	0 large tree(s)
Location category	Location 2  The native vegetation is in an area mapped as an Endangered Ecological Vegetation Class. Removal of less than 0.5 hectares of native vegetation will not have a significant impact on any habitat for a rare or threatened species.

### Offset requirement

#### The offset requirement that will apply if the native vegetation is approved to be removed

Offset type	General offset
Offset amount	0.068 general habitat units
Offset attributes	
Vicinity	Corangamite Catchment Management Authority (CMA) or Golden Plains Shire Council
Minimum strategic biodiversity value score	0.464
Large trees	0 large tree(s)

## Native vegetation removal report

### Biodiversity information about the native vegetation

#### Description of any past native vegetation removal

Any native vegetation that was approved to be removed, or was removed without the required approvals, on the same property or on contiguous land in the same ownership, in the five year period before the application to remove native vegetation is lodged is detailed below.

Permit/PIN number	Extent of native vegetation (hectares)
None entered	0 hectares

#### Description of the native vegetation proposed to be removed

Extent of all mapped native vegetation	0.092 hectares
Condition score of all mapped native vegetation	0.623
Strategic biodiversity value score of all mapped native vegetation	0.580
Extent of patches native vegetation	0.061 hectares
1	0.061 hectares
Extent of scattered trees	0.031 hectares
No. large trees within patches	0 large tree(s)
No. large scattered trees	0 large tree(s)
No. small scattered trees	1 small tree(s)

#### Additional information about trees to be removed, shown in Figure 1

Tree ID	Tree circumference (cm)	Benchmark circumference (cm)	Scattered / Patch	Tree size
A	140	251	Scattered	Small

## Native vegetation removal report

### Other information

Applications to remove, destroy or lop native vegetation must include all the below information. If an appropriate response has not been provided the application is not complete.

#### Photographs of the native vegetation to be removed

Recent, dated photographs of the native vegetation to be removed must be provided with the application. All photographs must be clear, show whether the vegetation is a patch of native vegetation or scattered trees, and identify any large trees. If the area of native vegetation to be removed is large, provide photos that are indicative of the native vegetation.

Ensure photographs are attached to the application. If appropriate photographs have not been provided the application is not complete.

#### Topographical and land information

Description of the topographic and land information relating to the native vegetation to be removed, including any ridges, crests and hilltops, wetlands and waterways, slopes of more than 20 percent, drainage lines, low lying areas, saline discharge areas, and areas of existing erosion, as appropriate. This may be represented in a map or plan. **This is an application requirement and your application will be incomplete without it.**

Study area includes relatively flat land and one drainage line, Brunes Creek.

#### Avoid and minimise statement

This statement describes what has been done to avoid the removal of, and minimise impacts on the biodiversity and other values of native vegetation. **This is an application requirement and your application will be incomplete without it.**

The majority of native vegetation, is to be retained, some removal may be required , subject to permit conditions.

#### Defendable space statement

Where the removal of native vegetation is to create defendable space, a written statement explaining why the removal of native vegetation is necessary. This statement must have regard to other available bushfire risk mitigation measures. This statement is not required if your application also includes an application under the Bushfire Management Overlay.

Not applicable.

#### Offset statement

An offset statement that demonstrates that an offset is available and describes how the required offset will be secured. **This is an application requirement and your application will be incomplete without it.**

Offset to be secured by appropriate 3rd party purchase, there is reasonable assurance that offsets will be available.

## Native vegetation removal report

### Next steps

Applications to remove, destroy or lop native vegetation must address all the application requirements specified in *Guidelines for the removal, destruction or lopping of native vegetation*. If you wish to remove the mapped native vegetation you are required to apply for a permit from your local council. This *Native vegetation removal report* must be submitted with your application and meets most of the application requirements. The following needs to be added as applicable.

#### Property Vegetation Plan

Landowners can manage native vegetation on their property in the longer term by developing a Property Vegetation Plan (PVP) and entering in to an agreement with DELWP.

If an approved PVP applies to the land, ensure the PVP is attached to the application.

#### Applications under Clause 52.16

An application to remove, destroy or lop native vegetation is under Clause 52.16 if a Native Vegetation Precinct Plan (NVPP) applies to the land, and the proposed native vegetation removal is not in accordance with the relevant NVPP. If this is the case, a statement that explains how the proposal responds to the NVPP considerations must be provided.

If the application is under Clause 52.16, ensure a statement that explains how the proposal responds to the NVPP considerations is attached to the application.

# Native vegetation removal report

## Appendix 1 - Details of offset requirements

### Native vegetation to be removed

<b>Extent of all mapped native vegetation (for calculating habitat hectares)</b>	0.092	The area of land covered by a patch of native vegetation and/or a scattered tree, measured in hectares. Where the mapped native vegetation includes scattered trees, each tree is assigned a standard extent and converted to hectares. A small scattered tree is assigned a standard extent defined by a circle with a 10 metre radius and a large scattered tree a circle with a 15 metre radius.  The extent of all mapped native vegetation is an input to calculating the habitat hectares.
<b>Condition score*</b>	0.623	The condition score of native vegetation is a site-based measure that describes how close native vegetation is to its mature natural state. The condition score is the weighted average condition score of the mapped native vegetation calculated using the <i>Native vegetation condition map</i> .
<b>Habitat hectares</b>	0.057	Habitat hectares is a site-based measure that combines extent and condition of native vegetation. It is calculated by multiplying the extent of native vegetation by the condition score:  <b><i>Habitat hectares = extent x condition score</i></b>
<b>Strategic biodiversity value score</b>	0.580	The strategic biodiversity value score represents the complementary contribution to Victoria's biodiversity of a location, relative to other locations across the state. This score is the weighted average strategic biodiversity value score of the mapped native vegetation calculated using the <i>Strategic biodiversity value map</i> .
<b>General landscape factor</b>	0.790	The general landscape factor is an adjusted strategic biodiversity value score. It has been adjusted to reduce the influence of landscape scale information on the general habitat score.
<b>General habitat score</b>	0.045	The general habitat score combines site-based and landscape scale information to obtain an overall measure of the biodiversity value of the native vegetation. The general habitat score is calculated as follows:  <b><i>General habitat score = habitat hectares x general landscape factor</i></b>

\* **Offset requirements for partial removal:** If your proposal is to remove parts of the native vegetation in a patch (for example only understorey plants) the condition score must be adjusted. This will require manual editing of the condition score and an update to the calculations that the native vegetation removal tool has provided: habitat hectares, general habitat score and offset amount.

### Offset requirements

<b>Offset type</b>	General offset	A general offset is required when the removal of native vegetation does not have a significant impact on any habitat for rare or threatened species. All proposals in the Basic and Intermediate assessment pathways will only require a general offset.
<b>Offset multiplier</b>	1.5	This multiplier is used to address the risk that the predicted outcomes for gain will not be achieved, and therefore will not adequately compensate the biodiversity loss from the removal of native vegetation.
<b>Offset amount (general habitat units)</b>	0.068	The general habitat units are the amount of offset that must be secured if the application is approved. This offset requirement will be a condition to any permit or approval for the removal of native vegetation.  <b><i>General habitat units required = general habitat score x 1.5</i></b>
<b>Minimum strategic biodiversity value score</b>	0.464	The offset site must have a strategic biodiversity value score of at least 80 per cent of the strategic biodiversity value score of the native vegetation to be removed. This is to ensure offsets are located in areas with a strategic biodiversity value that is comparable to the native vegetation to be removed.
<b>Vicinity</b>	Corangamite CMA or Golden Plains Shire Council	The offset site must be located within the same Catchment Management Authority boundary or municipal district as the native vegetation to be removed.
<b>Large trees</b>	0 large tree (s)	The offset site must protect at least one large tree for every large tree removed. A large tree is a native canopy tree with a Diameter at Breast Height greater than or equal to the large tree benchmark for the local Ecological Vegetation Class. A large tree can be either a large scattered tree or a large patch tree.

## **Appendix 3 Determining the Tree Protection Zone**

### **Determining the Tree Protection Zone (TPZ)**

The radius of the TPZ is calculated for each tree by multiplying its DBH x 12.  $TPZ = DBH \times 12$  (Australian Standard AS4970-2009 *Protection of trees on development sites*)

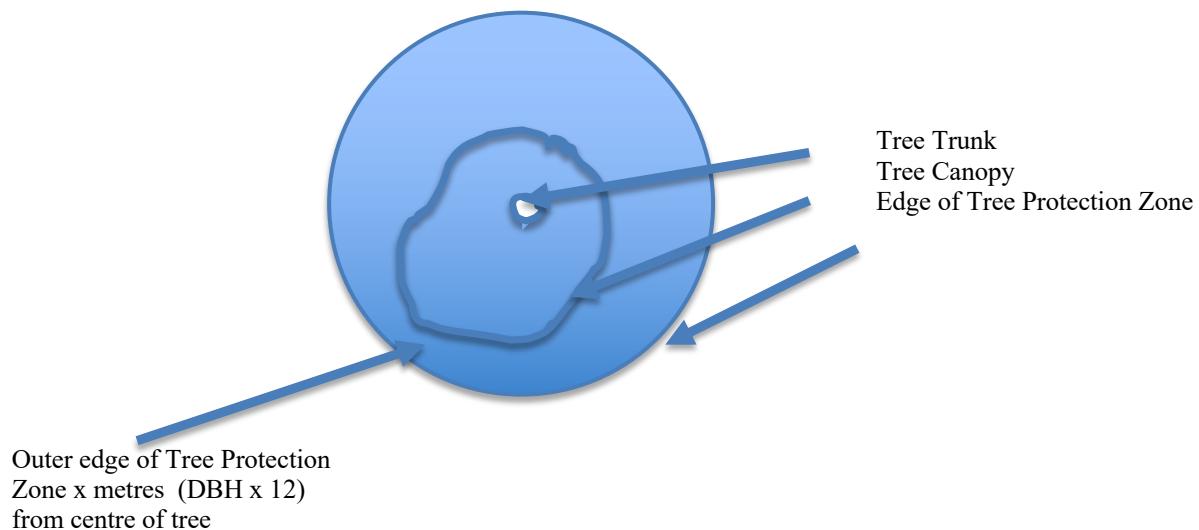

Where

DBH = trunk diameter measured at 1.4 metres above ground Radius is measured from the centre of the stem at ground level.

A TPZ should not be less than 2 metres no greater than 15 metres (except where crown protection is required.). Some instances may require variations to the TPZ.

A tree is deemed to be impacted upon if greater than 10% of the TPZ area is to be disturbed.

### **Indicative Size of Tree Protection Zone**

## 1.0 EXECUTIVE SUMMARY

### 1.1 Background

Ministerial Direction No. 1 – Potentially Contaminated Land ('Direction No. 1') requires planning authorities when preparing planning scheme amendments, to satisfy themselves that the environmental conditions of land proposed to be used for a sensitive use (defined as residential, child-care centre, pre-school centre or primary school), agriculture or public open space are, or will be, suitable for that use.

The planning system is the primary means for regulating land use and approving development and is an important mechanism for triggering the consideration of potentially contaminated land.

Potentially contaminated land is defined in Ministerial Direction No. 1 – Potentially Contaminated Land, as land used or known to have been used for industry, mining or the storage of chemicals, gas, wastes or liquid fuel (if not ancillary to another use of land). This practice note also deals with land that may have been contaminated by other means such as by ancillary activities, contamination from surrounding land, fill using contaminated soil or agricultural uses.

Contamination of land is often a result of current or historical activities that have taken place at a site, or adjacent to it. To identify the potential for contamination, the following steps may assist:

- Consider any available information about the site;
- The current and previous zoning, ownership or activities carried out on the site (for example council, rail, other utility or defence); and
- Any potential contamination from surrounding land uses (for example, an adjacent service station known to be causing off-site contamination).
- Inspect the site. Observations should be made regarding evidence of contamination or historical activities that may give rise to contamination (for example, fuel tanks).

This Environmental Assessment will cover the previously mentioned criteria and also provide a conclusion regarding the likely contamination status of the site.

### 1.2 Environmental Assessment Conclusions

<b>Conclusions</b>	<p>There is a Low likelihood of chemical contamination of soil in the paddocks due to application of fertilisers and/or herbicides.</p> <p>There is a Low likelihood of contamination of soil at the site due to other chemicals.</p> <p>There is a Low likelihood of contamination of soil at the site due to industrial waste.</p> <p>There is a Low probability of occurrence of Acid Sulfate soils on site.</p> <p>The site is surrounded by low risk properties.</p> <p>There is no apparent soil staining, soil discolouration or odours at the site.</p> <p>There is no apparent asbestos contamination.</p> <p>There is no apparent Prescribed Industrial Waste or Putrescible Waste.</p> <p>There is no apparent imported fill on site.</p>
<b>Risk of Contamination</b>	<p>Based on all available information, this soil at the site has a Low risk of contamination.</p> <p>All soils analysed were BELOW the upper thresholds for NEPM HIL A, HSL A/B, ESLs (Urban Residential) and Management Limits (Residential/Parkland). They are therefore considered suitable for conventional residential purposes.</p>

## 2.0 INTRODUCTION, OBJECTIVES, SCOPE OF WORKS

### 2.1 Introduction

Environmental Site Assessments Pty Ltd ('ESA') was engaged by TGM Group Pty Ltd (the 'Client') to undertake an Environmental Assessment including a limited soil sampling program at 5, 20, 25 & 30 Ormond Street Bannockburn (the 'Site'). Currently, the site consists of four houses and associated garage buildings, sheds, one former vineyard and several vacant paddocks.

### 2.2 Project Objective

The purpose of the environmental assessment is to establish:

- Whether known previous or current land uses may have caused contamination on the site; and
- What the contaminants of concern are likely to be and where they are located.

### 2.3 Scope of Works

Environmental Site Assessments provided the following services as part of the scope of works:

- A physical site inspection noting areas of potential contamination;
- The collection of targeted and grid-based soil samples;
- Analysis of soil samples for contaminants of potential concern; and
- Preparation of a report which summarises the likely contamination status of the site.

## 3.0 THE SITE

The site is zoned as Farming Zone ('FZ') and is located in Bannockburn. Currently, the site consists of vacant paddocks, one paddock containing unused grapevines, four houses and garages, and 8 sheds of varying sizes. The soil profile was checked at forty-five points across the site and there was no indication of chemical or other contamination.

### 3.1 Potential Contaminants of Concern

According to AS4482.1<sup>1</sup>, the site has the following potential contaminants of concern due to its previous land uses:

- Fertilisers – Copper, Cadmium;
- Herbicides – Arsenic, Mercury, Organochlorines, Organophosphates; and
- Fuels/Oils – Hydrocarbons, Metals.

There were no instances of Asbestos Containing Material ('ACM') observed on site.

## 4.0 SITE INSPECTION

<b>4.1 Land Parcel Site Inspection Details</b>	
<b>Date and Time of Inspection</b>	30 April 2018, 09:00
<b>Weather Conditions</b>	Fine and sunny
<b>Current Site Use</b>	Agistment.
<b>Previous Site Uses</b>	Farming, Agistment.
<b>Site Coverage incl. condition and type of ground cover, e.g. bare ground, asphalt, concrete, gravel, etc.</b>	The site is predominantly comprised of paddocks with grass, and some established trees. One paddock contained grapevines. Gravel was present on residential driveways. No soil staining or odours were apparent.
<b>Current Adjacent Land Uses incl. the apparent condition of adjacent properties</b>	Residential/Farming. All properties appear to be in good condition.
<b>Details of Structures on site incl. location and condition of all visible features, including foundations, positions of former buildings, tanks, pits, wells, drains and bores.</b>	Water tanks were present in the vicinity of the residential buildings at 5 and 30 Ormond Street. Each property had at least one shed, ranging in size from a small garden shed to large farming shed. All sheds were located in proximity to the residential buildings on each property.

<sup>1</sup> AS 4482.1-2005 Guide to the investigation and sampling of sites with potentially contaminated soil - Non-volatile and Semi-Volatile compounds

<b>Process Details (in relation to current site use)</b>	There are currently no processes on site.
<b>Details of Chemical use incl. chemical storage and transfer areas, including the presence of waste or chemical containers</b>	Chemical signs were present on a shed at 5 Ormond Road. One paddock on this property contains grapevines. These signs would likely refer to pesticides used on the vineyard.
<b>Presence of above ground storage tanks</b>	Water tanks were present in the vicinity of the residential buildings at 5 and 30 Ormond Street.
<b>Presence of underground storage tanks</b>	Nil apparent.
<b>Presence of septic tanks</b>	Nil apparent.
<b>Details of waste handling</b>	Nil apparent.
<b>Evidence of burning of burying of waste</b>	Nil apparent.
<b>Spill Incidents</b>	Nil apparent.
<b>Spill control systems, e.g. bund (materials of construction should be noted)</b>	Nil apparent.
<b>Locations of dispensing or fill points</b>	Nil apparent.
<b>Evidence of Fill Materials</b>	Nil apparent.
<b>Evidence of Scrap and industrial or chemical waste</b>	Nil apparent.
<b>Evidence of settlement, subsidence and disturbed ground</b>	Nil apparent.
<b>Evidence of on site or adjacent cut and fill activities or quarrying</b>	Nil apparent.
<b>Evidence of Contamination (discoloured soil, polluted water, affected plant growth)</b>	Nil apparent.
<b>Potential Asbestos containing material</b>	Nil apparent.
<b>Animal populations</b>	Horses, ponies, rabbits.
<b>Significant odours</b>	Nil apparent.
<b>Assessment of soil loss or deposition that has occurred in the past and evaluation of the future erosion potential</b>	Nil apparent.
<b>Transformers</b>	Nil apparent.

## 4.2 Site Inspection Conclusions and Recommendations

<b>Conclusions</b>	<p>There is a Medium likelihood of chemical contamination of surface soils in the paddocks due to application of fertilisers and/or herbicides.</p> <p>There is a Medium likelihood of chemical contamination of surface soils in the vicinity of the small buildings.</p> <p>There is a Low likelihood of contamination of soil at the site due to industrial waste.</p> <p>There is a Low probability of occurrence of Acid Sulfate soils on site.</p> <p>The site is surrounded by low risk properties.</p>
--------------------	--

	<p>There is no apparent soil staining, soil discolouration or odours at the site.</p> <p>There is no apparent asbestos contamination.</p> <p>There is no apparent Prescribed Industrial Waste or Putrescible Waste.</p> <p>There is no apparent imported fill on site.</p>
<b>Risk of Contamination</b>	Based on information collected to this point, soils at the site have a Low-Medium risk of contamination.
<b>Recommendations</b>	<p>Surface soil samples from the paddocks are required to discount impacts due to fertiliser/herbicide contamination.</p> <p>Additional samples of soil are required to be collected from around the small buildings. These would be the likely areas where chemical/hydrocarbon impacts would be found due to vehicle traffic and potential capacity for fuel/oil/chemical storage.</p>

## 5.0 SOIL SAMPLING PROGRAM

This sampling program was undertaken on site on the 30<sup>th</sup> of April, 2018. Samples were collected by ESA staff from the surface soils (0-0.15m BGL) by hand auger. The auger was cleaned between samples with phosphate free detergent and rinsed with deionised water. The approximate sampling points for the site are shown in **Appendix 1**.

Table 5.0 illustrates the samples that were collected. The samples that were collected consisted of SANDY SILT: Low Plasticity, Brown, Fine Grains, Dry.

A Photoionisation Detector ('PID') was employed to screen samples for Volatile Organic Compounds ('VOC'). The following methodology was employed:

- A sample of soil was carefully collected with minimal disturbance that could cause loss of volatile constituents;
- The sample was immediately extruded into a plastic bag and sealed;
- The sealed bag containing the sample was crushed between the fingers to disperse the sample and release volatile constituents;
- The inlet tube of the PID was then inserted through a small opening in the bag into the headspace over the sample; and
- The PID response (in ppm) was measured within 2-3 seconds and the result recorded on the field form.

The PID calibration form is attached as **Appendix 2**.

\*\* = 15 Metals including As, Ba, Be, B, Cd, Cr, Co, Cu, Hg, Mn, Ni, Pb, Se V, Zn

The following sections describe the guidelines, standards and investigation methods adopted for the soil sampling program.

## 5.1 Relevant Guidelines and Standards

The sampling program was undertaken in accordance with the following guidelines, standards and policies:

- Australia Standard (AS 4482.1) - Guide to the Investigation and Sampling of Sites with Potentially Contaminated Soil, Part 1: Non-volatile and Semi-volatile compounds (Standards Australia, 2005);
- Australia Standard (AS 4482.2) - Guide to the Sampling and Investigation of Potentially Contaminated Soil, Part 2: Volatile Substances (Standards Australia, 1999);
- National Environment Protection (Assessment of Site Contamination) Measure 1999 (Amended); and
- State Environment Protection Policy (Prevention and Management of Contamination of Land) No. S95, EPA Victoria, June 2002.

## 5.2 Quality Assurance / Quality Control

### 5.2.1 Environmental Site Assessments Quality Assurance ('QA') Program

Environmental Site Assessments has developed and implemented a Quality Assurance Program in general accordance with the following guidelines:

- Australia Standard (AS 4482.1) - Guide to the Investigation and Sampling of Sites with Potentially Contaminated Soil, Part 1: Non-volatile and Semi-volatile compounds (Standards Australia, 2005); and
- National Environment Protection Council (NEPC) - National Environment Protection (Assessment of Site Contamination) Measure (NEPM) - Schedule B3 Guideline on Laboratory Analysis of Potentially Contaminated Soils, 1999 (Amended).

As part of the Quality Assurance Program, Environmental Site Assessments ensures that the following methodology is employed:

- The use of appropriately qualified and trained environmental scientists to perform intrusive works;
- The use of standardised field sheets to record the findings of the site investigations;
- The collection and analysis of Quality Control samples as per AS 4482.1;
- The use of Chain of Custody procedures to ensure that sample integrity is maintained through the transport and handling stages; and
- Only using NATA accredited laboratories for the analysis of samples collected during the investigation activities.

As per the Environmental Site Assessments Quality Assurance Program, the following data quality indicators were used for the assessment of the laboratory analytical data:

- All sample analysis to be conducted using NATA registered methods in accordance with NEPM 1999 (Amended) guidelines;
- Laboratory method blank analysis required to be below the Limit of Reporting (LOR); and
- Surrogate compound concentrations required to be spiked at similar concentration to sample result.

## **5.2.2 Environmental Site Assessments Quality Control ('QC') Program**

The overall precision of field quality control samples, laboratory split samples and laboratory duplicates is generally assessed by their Relative Percentage Difference (RPD), given by:

$$\frac{(C1 - C2) \times 100}{\frac{(C1 + C2)}{2}}$$

Where:

C1 is the primary sample concentration.

C2 is the duplicate sample concentration.

The Relative Percentage Difference (RPD) of duplicated analysis were calculated and compared to the following criteria for acceptability. The acceptance criteria are listed in AS4482.1 (2005):

- Less than 30-50% for field duplicates (blind replicate and split samples);
- Less than 30% for laboratory duplicates where the detection is less than 10 times the LOR;
- Less than 20% for laboratory duplicates where the detection is greater than 10 times the LOR;
- RPDs for control spike duplicates will be compared to an acceptable limit of 20%;
- RPDs for matrix spike duplicates will be compared to an acceptable limit of 20%; and
- Percentage recoveries of control spikes and matrix spikes will be compared to an acceptable range of 70% – 130%. Where this range is exceeded, reference to the laboratories internal data quality objective limits will be made. In addition, percentage recoveries of surrogates will also be compared to the USEPA surrogate recovery limits.

## **5.2.3 Sample Documentation**

All samples collected were labelled in a clear and precise way for proper identification in the field and for tracking in the laboratory.

The samples had identifiable and unique numbers. The sample labels contained the following information:

- Company name;
- Name of sampler;
- Sample ID; and
- Date/Time sample was collected.

Chain-of-custody forms were used to document sample collection and transport to laboratories for analysis. All sample transports for analysis were accompanied by a chain-of-custody form.

The chain-of-custody forms identified the contents of each transport and maintained the custodial integrity of the samples. The coolers in which samples were stored were sealed with self-adhesive custody seals. All custody seals were signed.

## **5.2.4 Packaging and Transport**

All sample containers were placed in a plastic cooler. The following outlines the packaging procedures that were followed for samples:

- When ice was used, it was packed in zip-locked, double plastic bags. The drain plug of the cooler was sealed with fiberglass tape to prevent melting ice from leaking out of the cooler;
- The bottom of the cooler was lined with bubble wrap to prevent breakage during transport;
- All glass sample containers were enclosed in bubble wrap to prevent breakage;
- Where required, empty space in the cooler was filled with bubble wrap to prevent movement and breakage during transport;
- Ice used to cool samples was placed on top and around the samples to chill them to the correct temperature; and
- Each cooler was securely taped shut with signed custody seals.

## **5.2.5 Field Notes**

The following information was recorded during the collection of each sample:

- Sample location and description;
- Sampling area sketch showing sample location and measured distances (where required);

- Sampler's name(s);
- Date and time of sample collection;
- Sample ID;
- Type of soil/material encountered (Fill, Natural etc.);
- PID readings;
- Field observations and details related to analysis or integrity of samples (e.g., weather conditions, noticeable odours, colours etc.);
- Soil descriptions as per AS1726-1993; and
- Sample preservation details.

In addition to the sampling information, the following specific information was also recorded in the field logbook:

- Team members and their responsibilities;
- Time of arrival/entry on site and time of site departure;
- Other personnel on site;
- Summary of any meetings or discussions;
- Deviations from sampling plans;
- Changes in personnel and responsibilities with reasons for the changes; and
- Calibration readings for any equipment used and equipment model and serial number.

## 5.3 Results of Analysis

**Investigation levels** and **screening levels** are the concentrations of a contaminant above which further appropriate investigation and evaluation will be required.

Investigation and screening levels provide the basis of Tier 1 risk assessment. A Tier 1 assessment is a risk-based analysis comparing site data with generic investigation and screening levels for various land uses to determine the need for further assessment or development of an appropriate management strategy. The application of investigation and screening levels is subject to a range of limitations.

**Health investigation levels ('HILs')** have been developed for a broad range of metals and organic substances. The HILs are applicable for assessing human health risk via all relevant pathways of exposure. The HILs are generic to all soil types and apply generally to a depth of 3m below the surface for residential use. Site-specific conditions should determine the depth to which HILs apply for other land uses.

**Health screening levels ('HSLs')** have been developed for selected petroleum compounds and fractions and are applicable to assessing human health risk via the inhalation and direct contact pathways. The HSLs depend on specific soil physicochemical properties, land use scenarios, and the characteristics of building structures. They apply to different soil types, and depths below surface to >4m.

**Ecological screening levels ('ESLs')** have been developed for selected petroleum hydrocarbon compounds and total petroleum hydrocarbon (TPH) fractions and are applicable for assessing risk to terrestrial ecosystems. ESLs broadly apply to coarse- and fine-grained soils and various land uses. They are generally applicable to the top 2m of soil.

**Petroleum hydrocarbon management limits ('management limits')** are applicable to petroleum hydrocarbon compounds only. They are applicable as screening levels following evaluation of human health and ecological risks and risks to groundwater resources. They are relevant for operating sites where significant sub-surface leakage of petroleum compounds has occurred and when decommissioning industrial and commercial sites.

The laboratories used for conducting the soil analysis were Australian Laboratory Services Pty Ltd ('ALS') and Eurofins MGT ('MGT'). Both ALS and MGT are NATA certified for the analysis undertaken.

The comparison tables for laboratory results are attached in **Appendix 3**. All chain of custody forms, certificates of analysis and laboratory QA/QC documents are in **Appendix 4**. The laboratory report number is EM1716327.

The laboratory results were compared with NEPM 1999 (Amended) guidelines for HIL A, HSL A/B, ESLs (Urban Residential) and Management Limits (Residential/Parkland).

The comparison results were as follows:

- There were no results in excess of NEPM HIL A, HSL A/B, ESLs (Urban Residential) and Management Limits (Residential/Parkland) upper thresholds.

## 5.4 Laboratory QA/QC

As part of their NATA accreditation, ALS and MGT perform internal duplicate analysis of samples for comparison of results to demonstrate precision. Laboratory standards including matrix spike samples, laboratory control samples and surrogates are also conducted as a basis to demonstrate accuracy. In addition, internal laboratory blank samples are run to assess the potential for laboratory equipment errors. The laboratory QA/QC results are attached in **Appendix 4**.

#### **5.4.1 ALS Environmental Laboratory**

- For all matrices, no Method Blank value outliers occur.
- For all matrices, no Duplicate outliers occur.
- For all matrices, no Laboratory Control outliers occur.
- For all matrices, no Matrix Spike outlier occurred.
- For all matrices, no Surrogate Recovery outliers occur.

#### **5.4.2 Eurofins MGT Laboratory**

- For all matrices, no Method Blank value outliers occur.
- For all matrices, no Duplicate outliers occur.
- For all matrices, no Laboratory Control outliers occur.
- For all matrices, no Matrix Spike outlier occurred.
- For all matrices, no Surrogate Recovery outliers occur.

#### **5.4.3 Sample Holding Times and Sample Receipt Temperature**

Sample holding times were within acceptable ranges from collection to extraction. The documented temperature of samples upon receipt at the respective laboratory was within an acceptable range.

#### **5.4.4 Conclusion**

A review of the laboratory reports indicates that ALS and MGT have met their internal acceptance criteria for the quality control samples.

### **5.5 Field Quality Control Samples**

#### **5.5.1 Blind Replicate and Split samples**

The relative percentage difference was calculated for the blind (QC06 and QC08) and split samples (QC07 and QC09). The comparison table is attached to **Appendix 3**. There were two RPDs (Manganese and Zinc) for the split sample QC09 that were greater than 50%. This was likely due to the difference in interlab testing methodology and will not affect the outcome of this investigation.

#### **5.5.2 Trip, Field and Rinsate Blanks**

Trip blanks (QC01, QC02, QC03 & QC04) evaluate if the transport and handling procedures are introducing contaminants into the samples, and if cross contamination in the form of VOC migration has occurred between the collected samples. Field blanks (QC05) evaluate whether contaminants have been introduced into the samples during the sampling due to contamination from sample containers. Equipment rinsate blanks (QC10) evaluate field sampling and decontamination procedures.

Analysis of these Quality Control samples indicate that transport and handling, sample containers and decontamination procedures have not resulted in cross-contamination of the collected soil samples. The table of results is attached in **Appendix 3**.

## **6.0 CONCLUSION OF ENVIRONMENTAL ASSESSMENT**

<b>Conclusions</b>	<p>There is a Low likelihood of chemical contamination of soil in the paddocks due to application of fertilisers and/or herbicides.</p> <p>There is a Low likelihood of contamination of soil at the site due to other chemicals.</p> <p>There is a Low likelihood of contamination of soil at the site due to industrial waste.</p> <p>There is a Low probability of occurrence of Acid Sulfate soils on site.</p> <p>The site is surrounded by low risk properties.</p> <p>There is no apparent soil staining, soil discolouration or odours at the site.</p> <p>There is no apparent asbestos contamination.</p> <p>There is no apparent Prescribed Industrial Waste or Putrescible Waste.</p> <p>There is no apparent imported fill on site.</p>
<b>Risk of Contamination</b>	Based on all available information, this soil at the site has a Low risk of contamination.

	All soils analysed were BELOW the upper thresholds for NEPM HIL A, HSL A/B, ESLs (Urban Residential) and Management Limits (Residential/Parkland). They are therefore considered suitable for conventional residential purposes.

## **DISCLAIMER**

This disclaimer, together with any limitations specified in the report, applies to use of this report.

This report was prepared in accordance with a contracted scope of services. There were a series of cost, time and other constraints which have affected the accuracy and completeness of investigations undertaken.

This report has been prepared solely for use by, and is confidential to; the client who contracted the scope of services and Environmental Site Assessments accepts no responsibility for its use by other persons.

The contract for the preparation of this report contains express limitations upon the liability of Environmental Site Assessments which should be considered carefully. This report is subject to copyright protection and the copyright owner reserves its rights. This report does not constitute legal advice.

This report must be read in conjunction with the Statement of Qualifications and Limitations contained within it.

## **STATEMENT OF QUALIFICATIONS AND LIMITATIONS**

It is not possible to identify all contamination or potential contaminants in or under the surface of the site. This is an intrinsic risk when investigating potentially contaminated sites. As such, Environmental Site Assessments has prepared the following information which details the limitations of this environmental report.

In preparing this report, Environmental Site Assessments has relied on client/ third party information which was not verified by Environmental Site Assessments and Environmental Site Assessments does not accept responsibility for omissions or inaccuracies in the client/ third party information.

This report is based solely on the specific instructions received from its client and/or the scope of work agreed between Environmental Site Assessments and its client. Those instructions and/or scope of work may not be fully described in this report.

This report is based on the site conditions identified at the time of inspection. It is not possible to identify all contamination or potential contaminants in or under the surface of the site.

Investigations undertaken in respect of this report may have been constrained by the particular site conditions, such as the location of buildings, services and vegetation. Further, changes that may have occurred after inspection.

As a result of these matters, not all relevant site history, contaminants or potential for contamination may have been identified in this report.

No warranties express or implied, as to the accuracy or completeness of the matters contained within it are made.

Although normal standards of professional practice have been applied, the absence of any identified potential for air, soil or groundwater impacts on the subject property should not be interpreted as a conclusion that impacts do not exist on the site.

Subsurface conditions can vary across a particular site, which cannot be wholly defined by investigation.

As a result, it is unlikely that the results and estimations presented in this report will reflect the extremes of conditions within the site. Subsurface conditions including impact concentrations can change in a limited period of time. Any information provided may be based on "spot" tests. Conditions may vary between or beyond those locations from the interpreted conditions based on the actual data.

The analyses, evaluations, opinions and conclusions presented in this report are based on the information provided, and they could change if the information is in fact found to be unrepresentative of conditions between sampling and analysis locations.

The assessment and remediation of contamination is a developing science. Clean Up technology is constantly changing as scientific information on data collection, risk assessment, toxicology and remediation technologies are published. Further, opinions can vary as to the criterion for whether particular conditions constitute contamination, and if so how that contamination should be addressed or remediated. Different persons might reasonably or otherwise form opinions different to those of Environmental Site Assessments.

Use of the site for any purpose may require planning and other approvals and, in some cases, EPA and accredited site auditor approvals. Environmental Site Assessments offers no opinion as to the likelihood of obtaining any such approvals, or the conditions and obligations which such approvals may impose, which may include the requirement for significant environment works.

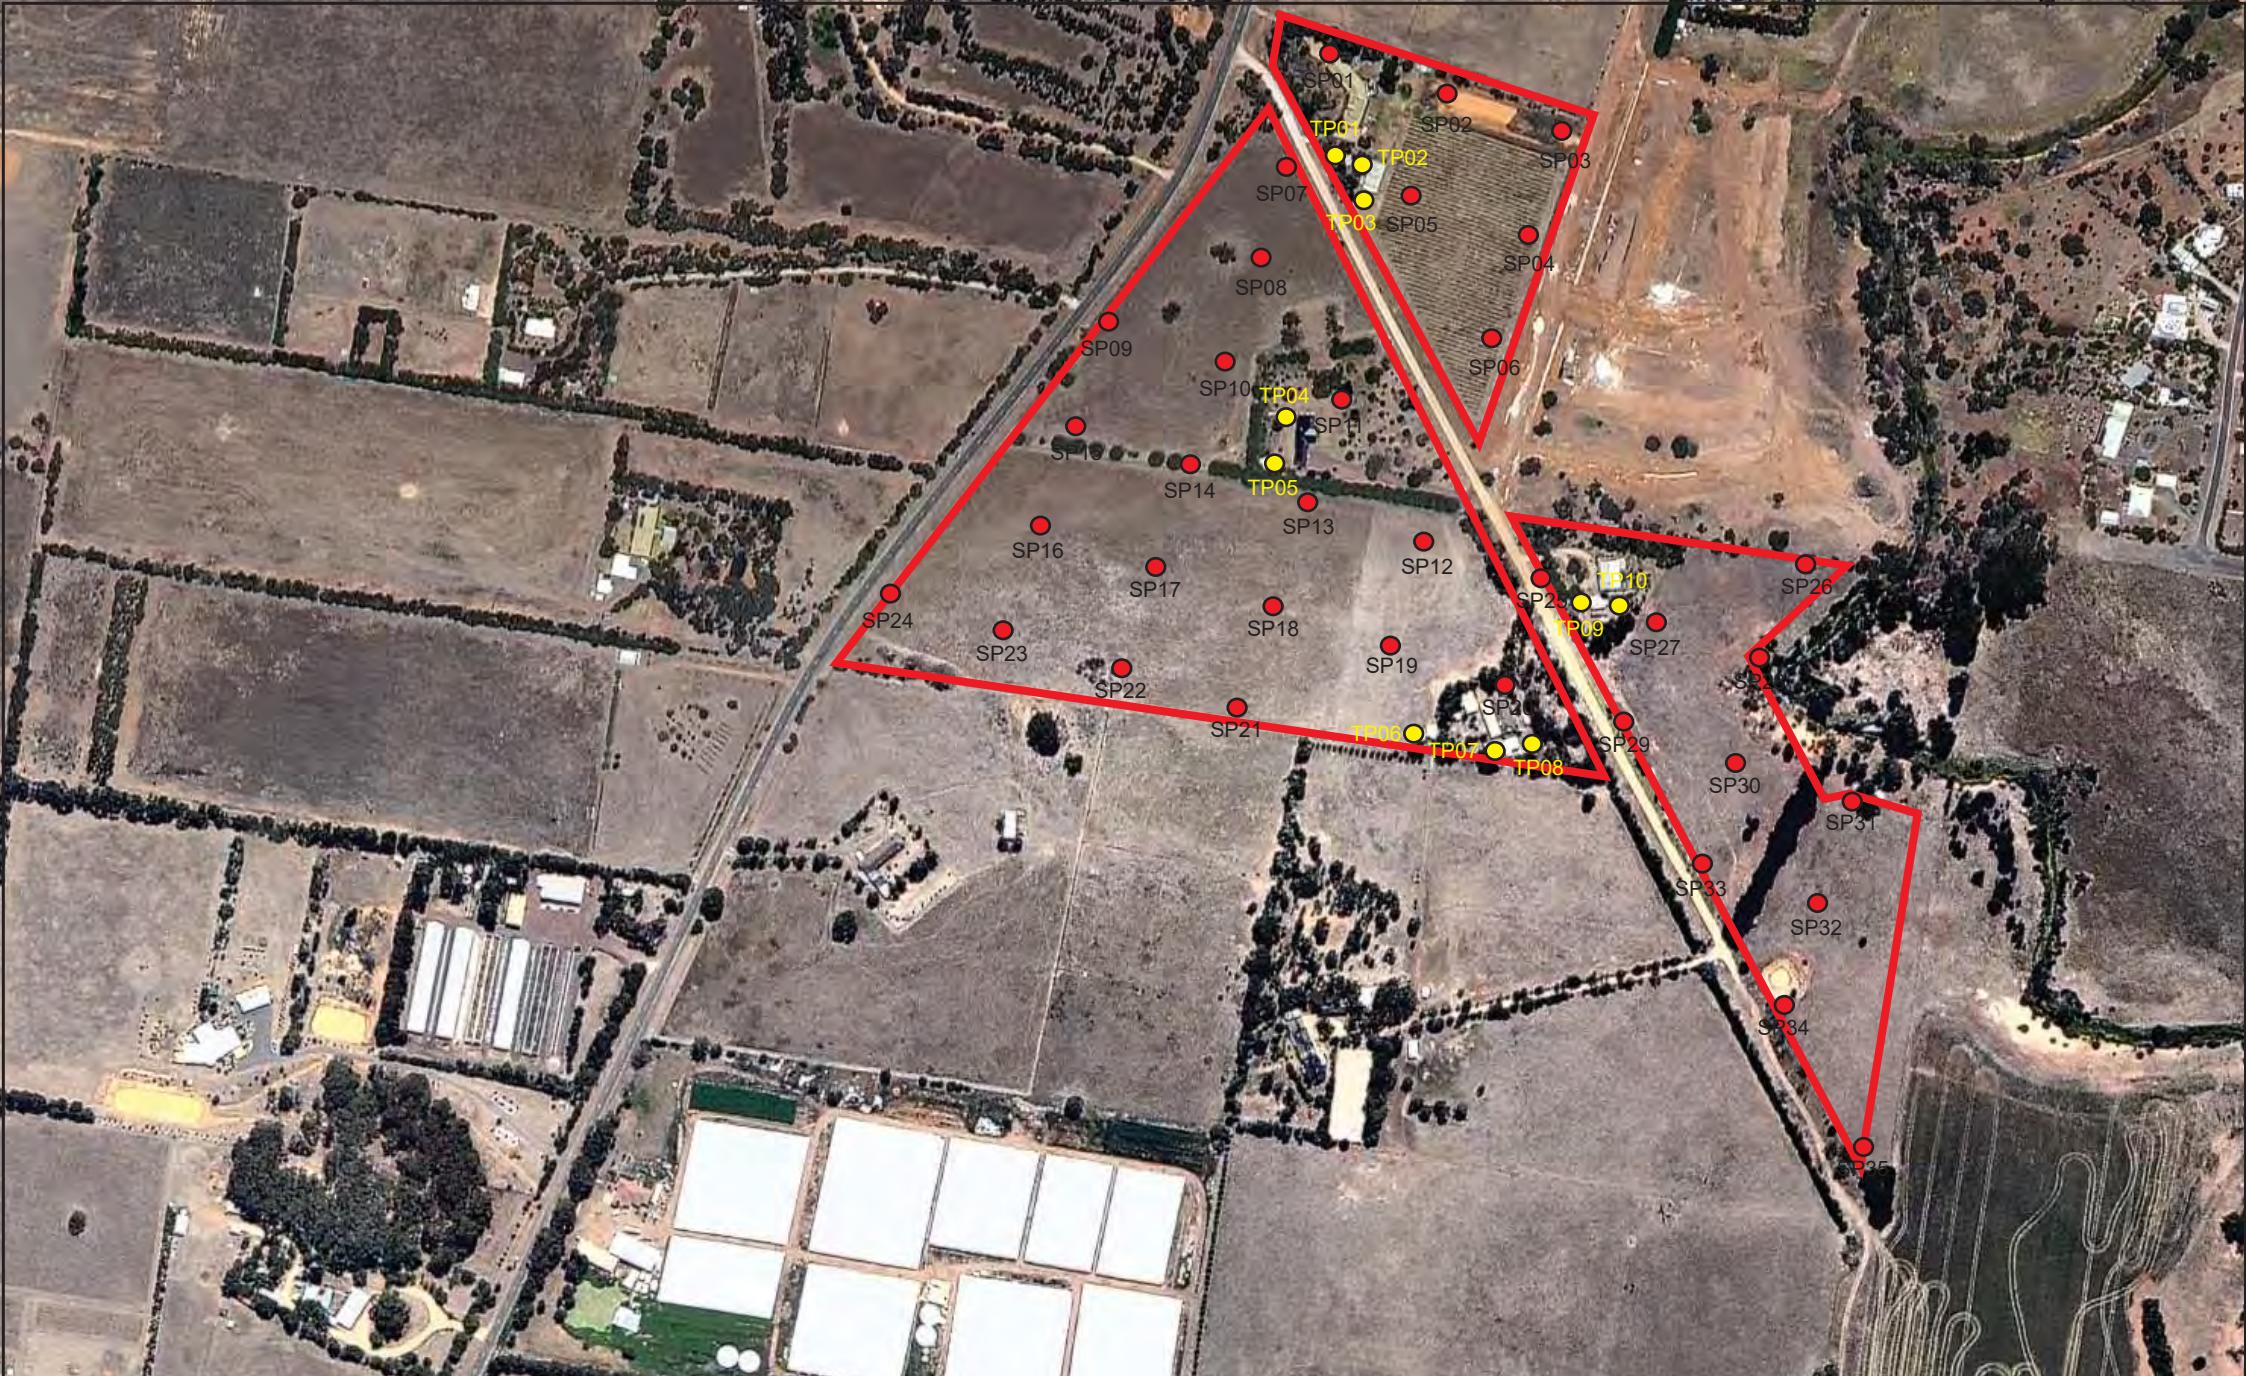

The ongoing use of the site or use of the site for a different purpose may require the owner/ user to manage and/ or remediate site conditions, such as contamination and other conditions, including but not limited to conditions referred to in this report.

This report is not intended to be used for the purposes of tendering, programming of works, refurbishment works or demolition works unless used in conjunction with a specification detailing the extent of the works.

To ensure its contextual integrity, the report must be read in its entirety and should not be copied, distributed or referred to in part only.

Environmental Site Assessments makes no determination or recommendation regarding a decision whether to acquire or provide financing with respect to the site.

\*RPDs have only been considered where a concentration is greater than 1 times the EQL.

\*\*High RPDs are in bold/Acceptable RPDs for each EQL multiplier range are: 80 (1-10 x EQL); 50 (10-30 x EQL); 30 (&gt; 30 x EQL).

\*\*\*Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory.

## CERTIFICATE OF ANALYSIS

Work Order	<b>: EM1807085</b>	Page	<b>: 1 of 48</b>
Client	<b>: ENVIRONMENTAL SITE ASSESSMENTS PTY LTD</b>	Laboratory	<b>: Environmental Division Melbourne</b>
Contact	<b>: MR SETON LILLAS</b>	Contact	<b>: Larissa Burns</b>
Address	<b>: P.O. BOX 3106 WAURN PONDS VIC 3216</b>	Address	<b>: 4 Westall Rd Springvale VIC Australia 3171</b>
Telephone	<b>: ----</b>	Telephone	<b>: +61-3-8549 9600</b>
Project	<b>: TGM Bannockburn</b>	Date Samples Received	<b>: 01-May-2018 09:05</b>
Order number	<b>: -----</b>	Date Analysis Commenced	<b>: 01-May-2018</b>
C-O-C number	<b>: -----</b>	Issue Date	<b>: 08-May-2018 16:44</b>
Sampler	<b>: AK</b>		
Site	<b>: -----</b>		
Quote number	<b>: MEBQ/159/15 V2</b>		
No. of samples received	<b>: 52</b>		
No. of samples analysed	<b>: 52</b>		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

### Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Dilani Fernando	Senior Inorganic Chemist	Melbourne Inorganics, Springvale, VIC
Nikki Stepniewski	Senior Inorganic Instrument Chemist	Melbourne Inorganics, Springvale, VIC
Xing Lin	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

Accreditation No. 825  
Accredited for compliance with  
ISO/IEC 17025 - Testing

## General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

Ø = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR.

Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.

## Analytical Results

Project	: TGM Bannockburn	Date Samples Received	: 01-May-2018
Order number	: -----	Date Analysis Commenced	: 01-May-2018
C-O-C number	: -----	Issue Date	: 08-May-2018
Sampler	: AK		
Site	: -----		
Quote number	: MEBQ/159/15 V2		
No. of samples received	: 52		
No. of samples analysed	: 52		

Accreditation No. 825  
Accredited for compliance with  
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

### **Signatories**

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Dilani Fernando	Senior Inorganic Chemist	Melbourne Inorganics, Springvale, VIC
Nikki Stepniewski	Senior Inorganic Instrument Chemist	Melbourne Inorganics, Springvale, VIC
Xing Lin	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

## General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot

CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

RPD = Relative Percentage Difference

# = Indicates failed QC

## Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

## Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

**Matrix Spike (MS) Report**

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

---

### **Summary of Outliers**

#### **Outliers : Quality Control Samples**

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- **NO** Matrix Spike outliers occur.
- For all regular sample matrices, **NO** surrogate recovery outliers occur.

#### **Outliers : Analysis Holding Time Compliance**

- **NO** Analysis Holding Time Outliers exist.

#### **Outliers : Frequency of Quality Control Samples**

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

## **Outliers : Frequency of Quality Control Samples**

## Matrix: WATER

Quality Control Sample Type	Count		Rate (%)		Quality Control Specification
	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)					
Pesticides by GCMS	0	2	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Pesticides by GCMS	0	2	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

## ***Analysis Holding Time Compliance***

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

## Matrix: SOIL

Evaluation: ✗ = Holding time breach ; ✓ = Within holding time.

## Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: SOIL

Evaluation: ✘ = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type	Analytical Methods	Method	Count		Rate (%)		Quality Control Specification
			QC	Regular	Actual	Expected	
<b>Laboratory Duplicates (DUP)</b>							
Hexavalent Chromium by Alkaline Digestion and DA Finish		EG048G	3	23	13.04	10.00	✓ NEPM 2013 B3 & ALS QC Standard

## Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl <sub>2</sub> ) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl <sub>2</sub> which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Hexavalent Chromium by Alkaline Digestion and DA Finish	EG048G	SOIL	In house: Referenced to USEPA SW846, Method 3060A. Hexavalent chromium is extracted by alkaline digestion. The digest is determined by photometrically by automatic discrete analyser, following pH adjustment. The instrument uses colour development using dephenylcarbazide. Each run of samples is measured against a five-point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
WAD Cyanide by Segmented Flow Analyser	EK028SF	SOIL	In house: Referenced to APHA 4500-CN-O. Caustic leachates of soil samples are introduced into an automated segmented flow analyser. Hydrogen cyanide is liberated from a slightly acidified (pH 4.5) and is dialysed. Tight cyanide complexes that would not be amenable to oxidation by chlorine are not converted. Iron cyanide complexes are precipitated with zinc acetate. Liberated HCN diffuses through a membrane into a stream of sodium hydroxide where it is carried as CN-. The cyanide in caustic solution is buffered to pH 5.2 and further converted to cyanogen chloride by reaction with chloramine-T. Cyanogen chloride subsequently reacts with 4- <i>pyridine carboxylic</i> and 1,3 - dimethylbarbituric acids to give a red colour complex. This colour is measured at 600 nm. This method is compliant with NEPM (2013) Schedule B(3)
Polychlorinated Biphenyls (PCB)	EP066	SOIL	In house: Referenced to USEPA SW 846 - 8270D Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 504)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270D Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM (2013) Schedule B(3) (Method 504,505)
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015A Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM amended 2013.
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270D. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 502 and 507)

Analytical Methods			
	Method	Matrix	Method Descriptions
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260B. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM amended 2013.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl <sub>2</sub> )(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl <sub>2</sub> which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	WATER	In house: Referenced to USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
Preparation Methods			
NaOH leach for CN in Soils	CN-PR	SOIL	In house: APHA 4500 CN. Samples are extracted by end-over-end tumbling with NaOH.
Alkaline digestion for Hexavalent Chromium	EG048PR	SOIL	In house: Referenced to USEPA SW846, Method 3060A.
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM (2013) Schedule B(3) (Method 202)
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na <sub>2</sub> SO <sub>4</sub> and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM (2013) Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatile Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

## Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.  
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions - Method: LTM-ORG-2010 TRH C6-C36	Melbourne	May 03, 2018	14 Day
Total Recoverable Hydrocarbons - 2013 NEPM Fractions - Method: TRH C6-C40 - LTM-ORG-2010	Melbourne	May 03, 2018	14 Day
Total Recoverable Hydrocarbons - 2013 NEPM Fractions - Method: TRH C6-C40 - LTM-ORG-2010	Melbourne	May 03, 2018	14 Day
Organochlorine Pesticides - Method: LTM-ORG-2220 OCP & PCB in Soil and Water	Melbourne	May 03, 2018	14 Day
Organophosphorus Pesticides - Method: LTM-ORG-2200 Organophosphorus Pesticides by GC-MS	Melbourne	May 03, 2018	14 Day
Chromium (hexavalent) - Method: APHA 3500-Cr Hexavalent Chromium- (Extraction:- USEPA3060)	Melbourne	May 03, 2018	28 Day
Heavy Metals - Method: LTM-MET-3030 by ICP-OES (hydride ICP-OES for Mercury)	Melbourne	May 03, 2018	180 Day
% Moisture - Method: LTM-GEN-7080 Moisture	Melbourne	May 02, 2018	14 Day

## Internal Quality Control Review and Glossary

### General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. This report replaces any interim results previously issued.

### Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

**\*\*NOTE:** pH duplicates are reported as a range NOT as RPD

### Units

**mg/kg:** milligrams per kilogram

**mg/L:** milligrams per litre

**ug/L:** micrograms per litre

**ppm:** Parts per million

**ppb:** Parts per billion

**%:** Percentage

**org/100mL:** Organisms per 100 millilitres

**NTU:** Nephelometric Turbidity Units

**MPN/100mL:** Most Probable Number of organisms per 100 millilitres

### Terms

<b>Dry</b>	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
<b>LOR</b>	Limit of Reporting.
<b>SPIKE</b>	Addition of the analyte to the sample and reported as percentage recovery.
<b>RPD</b>	Relative Percent Difference between two Duplicate pieces of analysis.
<b>LCS</b>	Laboratory Control Sample - reported as percent recovery.
<b>CRM</b>	Certified Reference Material - reported as percent recovery.
<b>Method Blank</b>	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
<b>Surr - Surrogate</b>	The addition of a like compound to the analyte target and reported as percentage recovery.
<b>Duplicate</b>	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
<b>USEPA</b>	United States Environmental Protection Agency
<b>APHA</b>	American Public Health Association
<b>TCLP</b>	Toxicity Characteristic Leaching Procedure
<b>COC</b>	Chain of Custody
<b>SRA</b>	Sample Receipt Advice
<b>QSM</b>	Quality Systems Manual ver 5.1 US Department of Defense
<b>CP</b>	Client Parent - QC was performed on samples pertaining to this report
<b>NCP</b>	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
<b>TEQ</b>	Toxic Equivalency Quotient

### QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

### QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

## Comments

### Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

### Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.

### Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.  
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

## Internal Quality Control Review and Glossary

### General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. This report replaces any interim results previously issued.

### Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

**\*\*NOTE:** pH duplicates are reported as a range NOT as RPD

### Units

**mg/kg:** milligrams per kilogram

**mg/L:** milligrams per litre

**ug/L:** micrograms per litre

**ppm:** Parts per million

**ppb:** Parts per billion

**%:** Percentage

**org/100mL:** Organisms per 100 millilitres

**NTU:** Nephelometric Turbidity Units

**MPN/100mL:** Most Probable Number of organisms per 100 millilitres

### Terms

<b>Dry</b>	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
<b>LOR</b>	Limit of Reporting.
<b>SPIKE</b>	Addition of the analyte to the sample and reported as percentage recovery.
<b>RPD</b>	Relative Percent Difference between two Duplicate pieces of analysis.
<b>LCS</b>	Laboratory Control Sample - reported as percent recovery.
<b>CRM</b>	Certified Reference Material - reported as percent recovery.
<b>Method Blank</b>	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
<b>Surr - Surrogate</b>	The addition of a like compound to the analyte target and reported as percentage recovery.
<b>Duplicate</b>	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
<b>USEPA</b>	United States Environmental Protection Agency
<b>APHA</b>	American Public Health Association
<b>TCLP</b>	Toxicity Characteristic Leaching Procedure
<b>COC</b>	Chain of Custody
<b>SRA</b>	Sample Receipt Advice
<b>QSM</b>	Quality Systems Manual ver 5.1 US Department of Defense
<b>CP</b>	Client Parent - QC was performed on samples pertaining to this report
<b>NCP</b>	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
<b>TEQ</b>	Toxic Equivalency Quotient

### QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

### QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

## Comments

## Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

## **Qualifier Codes/Comments**

Code	Description
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.

### i. INTRODUCTION

Provincial Geotechnical Pty Ltd has been commissioned to provide a Geotechnical Site Investigation report for the nominated address. We understand that construction of new municipal infrastructure is proposed.

The Location Plan is appended (Appendix i).

The site investigation hereby reported has been carried out with regard to the information supplied to us by our client or client's agents at the date of our commission. Should the client or his agent have omitted to supply us with relevant information or make significant changes to the building type, building envelope, or site our report may be irrelevant and/or inappropriate. No responsibility will be accepted by us for the consequences of such action. The client should acknowledge that this is a Geotechnical Site Investigation report specifically prepared for the proposed building development at the identified location and does not extend beyond that brief.

All site works related to the building project must be undertaken to comply with the relevant Codes and Standards and must not potentially adversely impact upon the building envelope. Provincial Geotechnical Pty Ltd accepts no liability or responsibility for any site works outside of our specific commission.

### ii. SITE CLASSIFICATION

The scope of AS2870-2011 allows for the classification of sites for some light commercial and institutional buildings. However, the proposed development appears to fall outside the scope of the code and the design should be based on engineering principles.

This site would normally be classified as CLASS P (PROBLEM SITE-ABNORMAL MOISTURE CONDITIONS), noting the underlying soil profile is moderately reactive CLASS M (Moderately Reactive Clay).

Site Classification is based upon Section 2 Clauses 2.2 of AS2870 - 2011. The method adopted for clay sites primarily includes 2.2.1 (a). Clause 2.2.1 (b) can be adopted under instruction from the client.

Classification of the site has taken into account the following:

- Identification of the sub soil profile.
- Field classification of the soil type and plasticity.

### iii. SITE SOIL CHARACTERISTICS SUMMARY

SITE FILLING: None encountered.

#### UNSUITABLE FOUNDATION

CONDITIONS: Depth to satisfactory foundation soils may necessitate localised deepening of footings in excess of standard types.

PERCHED WATER: None observed. The installation of suitable site drainage should ensure that destabilisation of the foundation soils does not occur.

# PROVINCIAL GEOTECHNICAL PTY. LTD.

## CONSULTING GEOLOGISTS

A.B.N. 88 090 400 114

### iii. SITE SOIL CHARACTERISTICS SUMMARY - continued

GROUND WATER:	None encountered.
BEDROCK:	None encountered.
FLOATERS:	None encountered.
ABNORMAL MOISTURE CONDITIONS:	Established vegetation present. Proximity and potential influence should be considered.
GEOLOGY:	Tertiary Sediments (Mapcode Nbm & Nhn) Identification assisted by reference to appropriate geological survey map. This report contains a geology map obtained from the Department of Natural Resources Geovic website including the site under investigation. It is provided as a guide to mapping of the local geology only and not to be used as a basis for design (Appendix ii).
SOIL TYPES:	Natural: Silty clayey sand topsoils overlying silty clays, typical of area's geology. Clays of the above sedimentary origin are generally considered moderately reactive.  Fill: None encountered.

### iv. TERRAIN EVALUATION SUMMARY

CLIMATIC ZONE:	CZ 2
SITE LOCATION:	North-east side of Ormond Street.
SLOPE:	Gentle fall over site predominantly to the east.
DRAINAGE:	SURFACE: Fair to Poor. SUB-SURFACE: Poor. Installation of cut off drains may be required.
EARTHQUAKE CLASS:	Australian Standard AS1170.4-2007, 'Minimum Design Loads on Structures, Part 4: 'Site Sub-Soil Class' outlines the methods for assigning the site's Sub-soil Class. Based on the anticipated stratigraphy, Table 4.1 'Maximum Depth Limits for Sub-Soil Class C' and Table 3.2 'Hazard Factor (Z) For Specific Australian Locations' of the standard, we recommend the following Hazard Factor and Sub-Soil Class are adopted: SUB-SOIL CLASS: Class C <sub>e</sub> – Shallow soil site HAZARD FACTOR (Z): 0.10

# PROVINCIAL GEOTECHNICAL PTY. LTD.

## CONSULTING GEOLOGISTS

A.B.N. 88 090 400 114

### iv. TERRAIN EVALUATION SUMMARY - continued

PROXIMATE VEGETATION (POTENTIAL ABNORMAL MOISTURE CONDITIONS):

GRASSES: Present.  
SHRUBS: Occasional present.  
TREES: Occasional present.

INFRASTRUCTURE WITHIN OR IN PROXIMITY TO BUILDING ENVELOPE: No. Greenfield site.

NOTE: The designing engineer should review available aerial mapping data and/or available site context information to assess the current or pre-existing conditions in respect to design considerations for Abnormal Moisture Conditions.

This report provides photographic evidence of either existing or pre-existing site context (Refer to Appendix iii).

### v. TESTING PROGRAMME

Four (4) test sites were established and excavated using a 100mm direct drive drilling rig at the approximate locations shown on the appended Test Site Location Plan (Appendix iv).

Where soil conditions dictated, investigation was assisted by the use of a penetrometer to confirm profile depth and condition. Where penetrometer testing is not undertaken the soil profile depths and conditions may be extrapolated from our knowledge of the geology and soils in this area.

Disturbed samples were collected and hand classified.

A vane shear apparatus was used to determine the strength of all cohesive soils in conjunction with tactile assessment.

Site history: The client is advised that site classification can be altered by past activities on this site not known at the time of our site investigation and report preparation. The client is advised that failure to investigate and report past history may invalidate the report.

### vi. FINDINGS

The soil profiles encountered are shown on the appended borelog sheet (Appendix v).

The cohesion value obtained is quoted on the log sheet.

The sedimentary nature and depth of the Tertiary aged soils indicates a moderate soil reactivity and seasonal heave potential.

The client should recognise that the soil profiles encountered during our testing are deemed representative of the building envelope for the purpose of classifications.

### vi. FINDINGS CONTINUED

The client should be aware however that in some cases soil conditions can change dramatically over short distances and although all effort is made to determine possible soil profile variations, no responsibility is taken for any undetected variations. The most careful exploration programme may not locate all soil profile variations due to time and economic restraints.

If footing excavations reveal soil conditions differing from those shown on the log sheet in this report, we recommend that Provincial Geotechnical be contacted immediately to carry out further testing to confirm or revise our conclusions and recommendations.

### vii. CONCLUSIONS AND RECOMMENDATIONS

#### 1. CONCRETE SLAB FLOOR – RESIDENTIAL STYLE STRUCTURES:

The use of stiffened raft slab construction is recommended for residential proportioned buildings constructed on a residual clay profile. An Allowable Bearing Pressure of 100kPa may be considered for preliminary proportioning of stiffened raft slab edge beams and internal load bearing ribs a minimum of 100mm into stiff clay.

Minimum dimensions and reinforcement of footings will need to meet the minimum requirements of Australian Standard AS2870-2011, 'Residential Slabs and Footings – Construction' for a CLASS M (Moderately Reactive Clay) site classification.

Where the depth of fill exceeds 0.3 metres it will be necessary to adopt suspended raft slab construction. All edge beams and internal ribs will need to be founded in stiff clay at the base of any fill and topsoils, and the slab panels will need to be designed as fully suspended.

A suspended concrete slab on piles may use an Allowable Bearing Pressure of 250kPa at a depth of 300mm into natural stiff clay and a minimum foundation depth of 1000mm below finished ground level.

Considerable attention to site drainage and existing (and any proposed or retained) trees will be required to ensure adequate performance of structures. Failure to take these factors into account will result in poor footing performance.

#### 2. LOW RISE STRUCTURES:

Strip and pad footings founded within residual clay are routinely adopted for flexible commercial style structures constructed on a clay foundation. The use of pad and strip footings founded on clay may be considered for any proposed low rise structures subject to:

- The superstructures being flexible and well-articulated. Steel portal framed construction and precast concrete panel construction normally satisfies this criteria.
- The superstructures not being sensitive to footing movements associated with seasonal volume changes within the clay.

# PROVINCIAL GEOTECHNICAL PTY. LTD.

## CONSULTING GEOLOGISTS

A.B.N. 88 090 400 114

### 2. LOW RISE STRUCTURES - CONTINUED:

- The moisture content regime of the clay beneath the structures being maintained as uniform as possible. The clays must not be subject to extremes in moisture conditions resulting from poor site drainage and/or the drying effects of trees.

If the proposed structures are not flexible and/or well-articulated, or the structures are sensitive to footing movements associated with seasonal volume changes within the highly plastic residual clay, it will be necessary to deepen the footings to a depth of negligible seasonal soil moisture variation.

Minimum dimensions and reinforcement of footings founded on clay should meet the minimum requirements of Australian Standard AS2870-2011, 'Residential Slabs and Footings – Construction' for a CLASS M site classification.

An Allowable Bearing Pressures of 250kPa may be considered for preliminary proportioning of strip and pad footings respectively where founded a minimum of 300mm into stiff clay, subject to a minimum founding depth of 1000mm. It is recommended that a uniform founding stratum be provided throughout any structure to minimize differential movements.

During our investigation a suitable foundation level was found at the following depths:

SITE	FOUNDATION DEPTH	FOUNDATION MATERIAL	ALLOWABLE BEARING PRESSURE
1	1000mm	Natural stiff clay	250kPa
2	1000mm	Natural stiff clay	250kPa
3	1000mm	Natural stiff clay	250kPa
4	1000mm	Natural stiff clay	250kPa

#### NOTE:

The site derived clays are not recommended for use as structural fill. Plastic clays are generally difficult to compact and are potentially subject to appreciable volume changes if they are not properly moisture conditioned. Use of a suitable imported granular or low plasticity clay fill will assist in assuring efficient placement and present less risk with respect to long term performance of structures and pavements based on soil reactivity.

Structural fill must be placed in uniform layers no exceeding a loose thickness of 200mm and compacted to at least 98% of the standard maximum dry density value as determined in accordance with Australian Standard AS1289 5.1.1-1993.

Australian Standard AS3798, 'Guidelines on Earthworks for Commercial and Residential Developments' provides guidance on the specification, execution and control of earthworks relevant to the subject site. Level 1 supervision in accordance with Australian Standard AS3798 is recommended for all proposed earthworks at the site.

Construction of pavements is likely to be problematic during the wetter months of the year. Pavement construction should be undertaken during the drier months of the year to avoid the need for additional subgrade improvement and delays in construction.

## **EXCAVATION/CONSTRUCTION DIFFICULTIES**

SITE VEHICLE ACCESS: Good.

SITE VEHICLE MANEUVERABILITY: Fair.

EXCAVATION CONDITIONS: The clays should be readily excavated using a 20 tonne capacity hydraulic excavator.

EXISTING STRUCTURES AROUND CONSTRUCTION AREA: No – greenfield site.

VEGETATION AROUND CONSTRUCTION AREA: Yes – on eastern boundary.

WET WEATHER IMPACT: Possible.

Sites without good natural or installed drainage can be adversely impacted upon during construction. The client should be aware that the following impacts can occur after wet weather.

- \* Site may become slippery and boggy.
- \* Foundation soils may become inundated and unworkable.
- \* Site drainage may need to be installed.
- \* Site may need to be abandoned for a period.
- \* Deeper footings or additional earthworks may be required.

## **ix. CONSTRUCTION REQUIREMENTS**

### **1. CONSTRUCTION ADJACENT TO EASEMENTS, EXCAVATIONS AND SERVICE PIPE TRENCHES**

Buried services should be located adjacent to footings. Where this cannot be avoided, the trench should be backfilled in such a way as to prevent moisture ingress. Any footings located adjacent to easements, excavations or backfilled service trenches should be founded below a line drawn up at 40° above horizontal from the base of the easement or excavation. If the angle of repose is to be intersected, a piled footing will be required.

### **2. SITE DRAINAGE AND MAINTENANCE OF FOOTINGS**

Effective drainage of the site should be maintained at all times. Water run-off should be collected and diverted away from all structures during construction. Water should not be allowed to pond against footings during or after construction. The ground adjacent to footings should be graded to provide a permanent fall of 1(V):50(H) away from the footings over the first two metres. Water supply and drainage infrastructure should be maintained so that no leakage occurs.

# PROVINCIAL GEOTECHNICAL PTY. LTD.

## CONSULTING GEOLOGISTS

A.B.N. 88 090 400 114

### **3. ARTICULATION OF STRUCTURE**

Adequate articulation should be provided in accordance with The Cement and Concrete Association of Australia – Technical Note TN61. In addition to the requirements of TN61, a full height articulation joint should be provided at the following locations:

- At the junction where two different footing types intersect.
- Where new structures adjoin existing structures.

### **4. INSPECTION OF FOOTING EXCAVATIONS**

All footing excavations should be inspected by a suitably qualified geotechnical consultant to ensure that the required founding stratum has been achieved. The presence of any unusual features or conditions should be brought to the attention of this office before construction proceeds.

For shallow footing and trench excavations, based on the ground conditions information obtained, it appears excavations will be predominantly in natural clays. Personnel should not be permitted to enter confined excavations in excess of 1.5 metres deep unless such excavations are appropriately battered or shored. Shallower excavations, particularly in loosely compacted fill, may also need to be battered or shored and will need to be assessed at the time of construction.

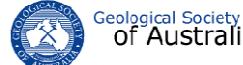

### **5. BATTER SLOPES**

It is recommended that temporary batter slopes should be steeper than 1H:1V, but flatter slopes may need to be considered within fill materials. Permanent batter slopes should not be steeper than 2H:1V and should be protected from erosion by vegetation or proprietary protection systems. Drainage should be provided at the top of batter slopes to divert run-off away from the slope face. The above recommendations are provided for batter slopes up to 3 metres in height; further geotechnical advice should be sought where higher batter slopes are proposed.

### **x. REPORT LIMITATIONS**

This report is for the use of the party to whom it is addressed only and has been produced for the proposed development as described and for no other purpose. It has been assumed that the conditions encountered by the limited number of boreholes are representative of the site in general. Some variation from the conditions encountered by the boreholes is expected over the site.

### NOTES

1. This form must be used for all transfers by the registered proprietor of an estate in fee simple other than
  - (a) transfers by direction
  - (b) transfers creating or reserving easements
  - (c) transfers containing a restrictive covenant or a covenant created pursuant to statute
  - (d) transfers of mortgages charges or leases or leasehold estates
  - (e) transfers of other than the full interest of the transferor  
for which the appropriate form must be used.
2. Transfers may be lodged as an original only and must be typed or completed in ink.
3. All signatures must be in ink.
4. If there is insufficient space in any panel to accommodate the required information use the above space or an annexure sheet (Form A1). Insert only the words "See Annexure A" (or as the case may be) in the appropriate panel and enter the information above or on the annexure sheet under the appropriate heading.  
Multiple annexures may appear on the same annexure sheet but each must be correctly headed.  
All annexure sheets should be properly identified and signed by the parties and securely attached to the instrument.
5. Volume and folio references must be given. If the whole of the land in a title is to be transferred no other description should be used. If the transfer affects part only of the land in a title the lot and plan number or Crown description should also be given. Any necessary diagram should be endorsed above or on an annexure sheet (Form A1).
6. Set out the amount (in figures) on the nature of the consideration.  
In a transfer on sale of land subject to a mortgage it should be clearly shown whether or not the amount owing under the mortgage is included in the consideration e.g. \$ ..... which includes the amount owing under mortgage No. ....
7. Insert full name. Address is not required.
8. Insert full name and address. If two or more transferees state whether as joint tenants or tenants in common. If tenants in common specify shares.
9. If an executing party is a natural person execution should read "Signed by the transferor (transferee) in the presence of ..... ". The witness must be an independent person. If an executing party is a body corporate execution should conform to any prescribed formalities relating to the affixing of the common seal.
